PRECAUTIONS AND PREPARATION

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description	
(J36471-A) Front heated oxygen sensor wrench	NT379	Loosening or tightening front heated oxygen sensor

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "Air Bag", used along with a seat belt, helps to reduce the risk or severity of injury to the driver in a frontal collision. The Supplemental Restraint System consists of an air bag module (located in the center of the steering wheel), a diagnosis sensor unit, warning lamp, wiring harness, crash zone sensor (4WD models) and spiral cable. Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death
 in the event of a collision which would result in air bag inflation, all maintenance must be performed
 by an authorized NISSAN dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or for the complete harness, for easy identification.

Precautions for On Board Diagnostic (OBD) System of Engine

The ECM (ECCS control module) has an on-board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

CAUTION:

- Be sure to turn the ignition switch "OFF" and disconnect the negative battery terminal before any
 repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc.
 will cause the MIL to light up.
- Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)
- Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.
- Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube
 may cause the MIL to light up due to the malfunction of the EGR system or fuel injection system,
 etc.
- Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM before returning the vehicle to the customer.

Engine Fuel & Emission Control System

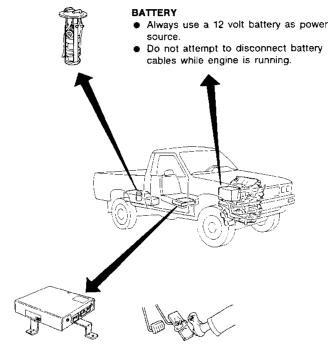

WIRELESS EQUIPMENT

- When installing CB ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on its installation location.
- Keep the antenna as far away as possible from the electronic control units.
- Keep the antenna feeder line more than 20 cm (7.9 in) away from the harness of electronic controls.
 Do not let them run parallel for a long distance.
- Adjust the antenna and feeder line so that the standing-wave ratio can be kept smaller.
- 4) Be sure to ground the radio to vehicle body.

FUEL PUMP

- Do not operate fuel pump when there is no fuel in lines.
- Tighten fuel hose clamps to the specified torque.

ECM

- Do not disassemble ECCS control module (ECM).
- Do not turn diagnosis mode selector forcibly.
- If a battery terminal is disconnected, the memory will return to the ECM

The ECCS will now start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a problem. Do not replace parts because of a slight variation.

WHEN STARTING

- Do not depress accelerator pedal when starting.
- Immediately after starting, do not rev up engine unnecessarily.
- Do not rev up engine just prior to shutdown.

ECCS PARTS HANDLING

- Handle mass air flow sensor carefully to avoid damage.
- Do not disassemble mass air flow sensor.
- Do not clean mass air flow sensor with any type of detergent.
- Do not disassemble IACV-AAC valve.
- Even a slight leak in the air intake system can cause serious problems.
- Do not shock or jar the camshaft position sensor.

ECCS HARNESS HANDLING

- Securely connect ECCS harness connectors.
 - A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- Keep ECCS harness at least 10 cm (3.9 in) away from adjacent harnesses, to prevent an ECCS system malfunction due to receiving external noise,
- Keep ECM parts and harnesses dry.
- Before removing parts, turn of ignition switch and then disconnect battery ground cable.

PRECAUTIONS AND PREPARATION

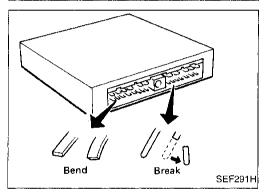

Precautions

 Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery terminal. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned off.

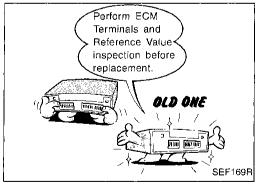

When connecting ECM harness connector, tighten securing bolt until the gap between orange indicators disappears.

(0.3 - 0.5 kg-m, 26 - 43 in-lb)

 When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).

Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

Before replacing ECM, perform ECM Terminals and Reference Value inspection and make sure ECM functions properly. Refer to EC-85.

 After performing each TROUBLE DIAGNOSIS, perform "OVERALL FUNCTION CHECK" or "DTC (Diagnostic Trouble Code) CONFIRMATION PROCEDURE".

The DTC should not be displayed in the "DTC CONFIRMATION PROCEDURE" if the repair is completed. The "OVERALL FUNCTION CHECK" should be a good result if the repair is completed.

PRECAUTIONS AND PREPARATION

Precautions (Cont'd)

 When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.
 Accidental contact of probes will cause a short circuit and damage the ECM power transistor. **G**[

ENGINE AND EMISSION CONTROL OVERALL SYSTEM

^{*1:} These sensors are not directly used to control the engine system. They are used only for the on board diagnosis.

^{*2:} This sensor is not used to control the engine system under normal conditions.

^{*3:} This switch will operate in place of the throttle position sensor to control EVAP parts if the sensor malfunctions.

Multiport Fuel Injection (MFI) System

INPUT/OUTPUT SIGNAL LINE

BASIC MULTIPORT FUEL INJECTION SYSTEM

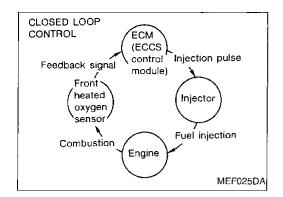

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and air intake) from both the camshaft position sensor and the mass air flow sensor.

VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injection is compensated for to improve engine performance under various operating conditions as listed below. (Fuel increase)

- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- High-load, high-speed operation (Fuel decrease)
- During deceleration
- During high engine speed operation

ENGINE AND EMISSION BASIC CONTROL SYSTEM DESCRIPTION

Multiport Fuel Injection (MFI) System (Cont'd) MIXTURE RATIO FEEDBACK CONTROL

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The three way catalyst can then better reduce CO, HC and NOx emissions. This system uses a front heated oxygen sensor in the exhaust manifold to monitor if the engine is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about front heated oxygen sensor, refer to page EC-124. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition. Rear heated oxygen sensor is located downstream of the three way catalyst. Even if the switching characteristics of the front heated oxygen sensor shift, the air-fuel ratio is controlled to stoichiometric by the signal from the rear heated oxygen sensor.

OPEN LOOP CONTROL

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Engine idling
- Malfunction of front heated oxygen sensor or its circuit
- Insufficient activation of front heated oxygen sensor at low engine coolant temperature
- High-engine coolant temperature
- During warm-up
- After shifting from "N" to "D"
- When starting the engine

MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from the front heated oxygen sensor. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both Manufacturing differences (i.e. mass air flow sensor hot wire) and characteristic changes during operation (i.e. injector clogging) directly affect mixture ratio.

Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short-term fuel trim and long-term fuel trim.

"Short-term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from the front heated oxygen sensor indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long-term fuel trim" is overall fuel compensation carried out longterm to compensate for continual deviation of the short-term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

ENGINE AND EMISSION BASIC CONTROL SYSTEM DESCRIPTION

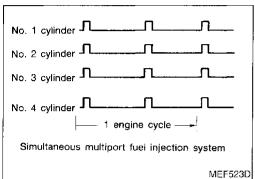

Multiport Fuel Injection (MFI) System (Cont'd) FUEL INJECTION TIMING

Two types of systems are used.

Sequential multiport fuel injection system

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

Simultaneous multiport fuel injection system

Fuel is injected simultaneously into all four cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.

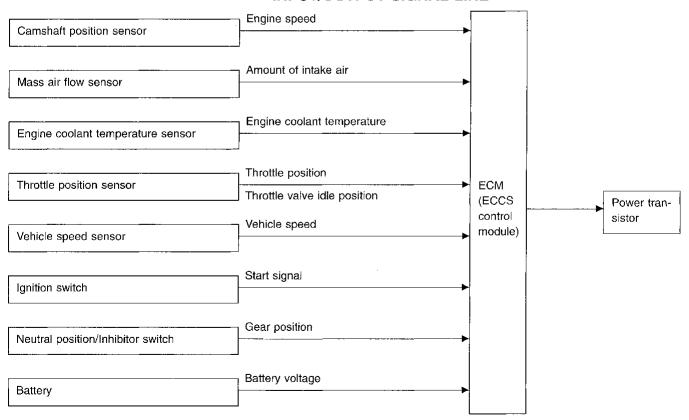

The four injectors will then receive the signals two times for each engine cycle.

This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

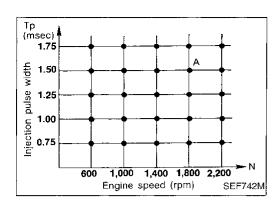

FUEL SHUT-OFF

Fuel to each cylinder is cut off during deceleration or operation of the engine at excessively high speeds.

Distributor Ignition (DI) System INPUT/OUTPUT SIGNAL LINE

ENGINE AND EMISSION BASIC CONTROL SYSTEM DESCRIPTION

Distributor Ignition (DI) System (Cont'd) SYSTEM DESCRIPTION

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine.

The ignition timing data is stored in the ECM. This data forms the map shown.

The ECM detects information such as the injection pulse width and camshaft position sensor signal. Responding to this information, ignition signals are transmitted to the power transistor.

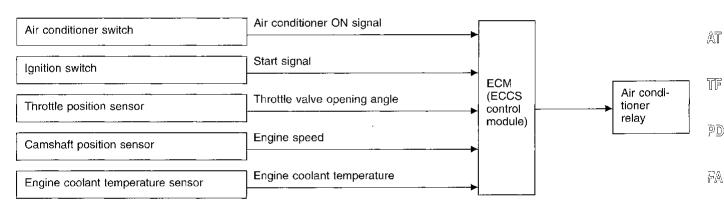

e.g. N: 1,800 rpm, Tp: 1.50 msec A °BTDC

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

- At starting
- During warm-up
- At idle
- When swirl control valve operates.
- Hot engine operation
- During acceleration

Air Conditioning Cut Control

INPUT/OUTPUT SIGNAL LINE

SYSTEM DESCRIPTION

This system improves engine operation when the air conditioner is used.

Under the following conditions, the air conditioner is turned off.

- When the accelerator pedal is fully depressed.
- When cranking the engine.
- When the engine coolant temperature becomes excessively high.

HA

EC-15 155

Fuel Cut Control (at no load & high engine speed)

INPUT/OUTPUT SIGNAL LINE

If the engine speed is above 3,500 rpm with no load (for example, in neutral and engine speed over 3,500 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.

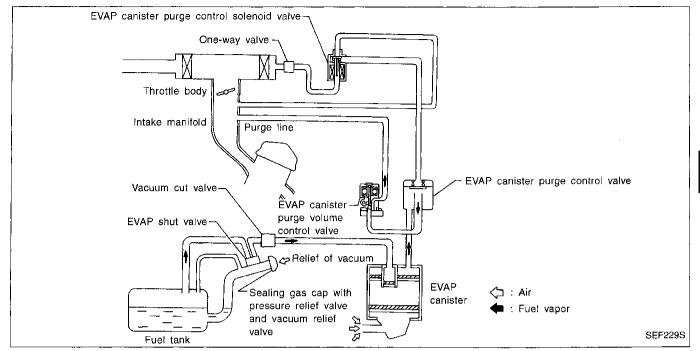

Fuel cut will operate until the engine speed reaches 1,500 rpm, then fuel cut is cancelled.

NOTE:

This function is different than deceleration control listed under multiport fuel injection on EC-12.

EVAPORATIVE EMISSION SYSTEM

Description

The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.

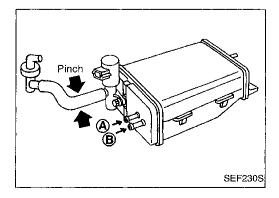

The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating.

EVAP canister purge volume control valve is controlled by engine control module. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control valve is proportionally regulated as the air flow increases.

EVAP canister purge control valve shuts off the vapor purge line during decelerating and idling, and under normal operating conditions the valve is usually open.

EVAP shut valve shuts off the vapor charge line when fuel is being supplied to the fuel tank.

Inspection

EVAP CANISTER

Check EVAP canister as follows:

- 1. Pinch the fresh air vent hose.
- Blow air in port (A) and check that it flows freely out of port (B).

EVAPORATIVE EMISSION SYSTEM

Inspection (Cont'd) TIGHTENING TORQUE

Tighten EVAP canister as shown in the figure.

FUEL TANK VACUUM RELIEF VALVE

- Wipe clean valve housing.
- Suck air through the cap. A slight resistance accompanied by valve clicks indicates that valve A is in good mechanical condition. Note also that, by further sucking air, the resistance should disappear with valve clicks.
- Blow air on fuel tank side and ensure that continuity of air passage exists through valve B.
- 4. If valve is clogged or if no resistance is felt, replace cap as an assembly.

CAUTION:

Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.

EVAPORATIVE EMISSION (EVAP) SHUT VALVE

- When pushing down the shutter inside the fuel filler opening, the EVAP shut valve is closed.
- When releasing the shutter, the valve is open.
- 1. Blow air from one side of the EVAP shut valve tube (a) or (b) and check that there is air flow.
- 2. Insert suitable steel tube as shown in the figure.
- 3. Blow air from one side of the EVAP shut valve tube (a) or (b) and check that there is no air flow.

EVAP CANISTER PURGE CONTROL VALVE

Refer to EC-189.

VACUUM CUT VALVE

Refer to EC-263.

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VOLUME CONTROL VALVE

POSITIVE CRANKCASE VENTILATION

Description

This system returns blow-by gas to the intake collector.

The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold.

During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve.

Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air.

The ventilating air is then drawn from the air duct into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover.

Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.

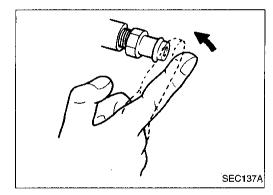

On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the intake collector under all conditions.

Œ

CL

Mili

Inspection

PCV (Positive Crankcase Ventilation) VALVE

With engine running at idle, remove PCV valve from breather separator. A properly working valve makes a hissing noise as air passes through it. A strong vacuum should be felt immediately when a finger is placed over the valve inlet.

RA

Disconnect all hoses and clean with compressed air. If any hose cannot be freed of obstructions, replace.

BT

HA

Si"

RS

Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.

- 1. Start engine.
- 2. Perform "FUEL PRESSURE RELEASE" in "WORK SUPPORT" mode with CONSULT. (Touch "START", and after engine stalls, crank it two or three times to release all fuel pressure.)
- 3. Turn ignition switch OFF.

- Remove fuse for fuel pump.
- 2. Start engine.
- 3. After engine stalls, crank it two or three times to release all fuel pressure.
- 4. Turn ignition switch OFF and reinstall fuel pump fuse.

Fuel Pressure Check

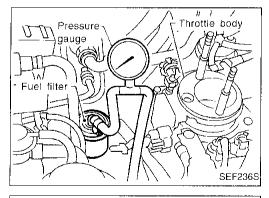

- a. When reconnecting fuel line, always use new clamps.
- Make sure that clamp screw does not contact adjacent parts.
- c. Use a torque driver to tighten clamps.
- d. Use Pressure Gauge to check fuel pressure.
- 1. Release fuel pressure to zero.
- Disconnect fuel hose between fuel filter and fuel tube (engine side).
- 3. Install pressure gauge between fuel filter and fuel tube.
- 4. Start engine and check for fuel leakage.
- Read the indication of fuel pressure gauge.

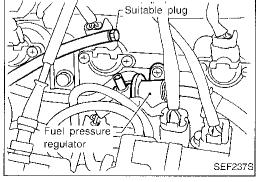

At idling:

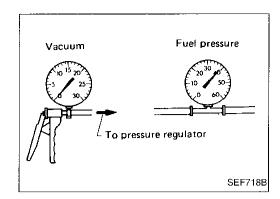

Approximately 235 kPa (2.4 kg/cm², 34 psi) A few seconds after ignition switch is turned OFF to ON:

Approximately 294 kPa (3.0 kg/cm², 43 psi)

- 6. Stop engine and disconnect fuel pressure regulator vacuum hose from intake manifold.
- 7. Plug intake manifold with a rubber cap.
- 8. Connect variable vacuum source to fuel pressure regulator.

Fuel Pressure Check (Cont'd)

9. Start engine and read indication of fuel pressure gauge as vacuum is changed.

Fuel pressure should decrease as vacuum increases. If results are unsatisfactory, replace fuel pressure regulator.

Fast Idle Inspection and Adjustment

- Remove air cleaner assembly.
- 2. Make sure the FIC alignment mark is centered on the lever roller as shown in the figure.
- An allignment mark is stamped on the FIC so that the top of the cam will face in the correct direction.

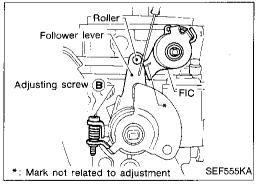

• If necessary, adjust the FIC screw (A) until the alignment mark is centered on the lever roller.

3. Start engine and warm up to operating temperature.

4. Measure clearance © between the lever roller and the top of the FIC using a feeler gauge as shown in the figure.

Clearance ©:
 M/T model
 2.0 - 2.6 mm (0.079 - 0.102 in)
 A/T model
 1.8 - 2.4 mm (0.071 - 0.094 in)

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment

PREPARATION

- Make sure that the following parts are in good order.
- (1) Battery
- (2) lanition system
- (3) Engine oil and coolant levels
- (4) Fuses
- (5) ECM harness connector
- (6) Vacuum hoses
- (7) Air intake system (Oil filler cap, oil level gauge, etc.)
- (8) Fuel pressure
- (9) Engine compression

Overall inspection sequence

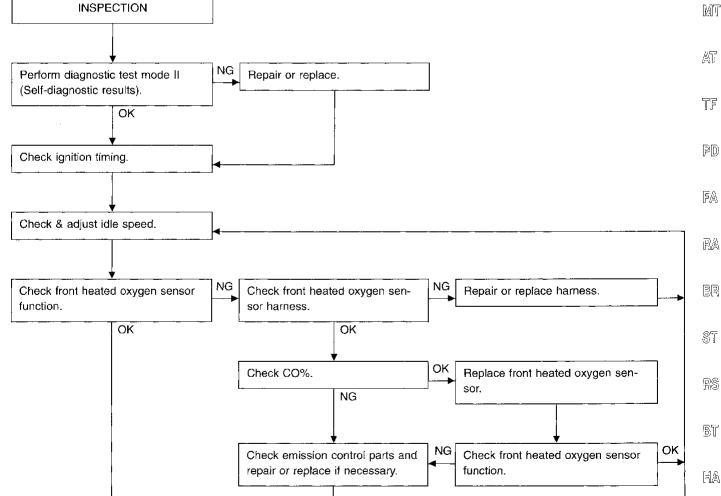

INSPECTION END

(11)Throttle valve

(12)Evaporative emission (EVAP) canister purge control valve

- On air conditioner equipped models, checks should be carried out while the air conditioner is "OFF".
- When checking idle speed, ignition timing and mixture ratio of A/T models, shift lever to "N" position.
- When measuring "CO" percentage, insert probe more than 40 cm (15.7 in) into tail pipe.
- Turn off headlamps, heater blower, rear defogger.
- Keep front wheels pointed straight ahead.
- Make the check after the cooling fan has stopped.

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment (Cont'd)

*: ECM may be the cause of a problem, but this is rarely the case.

Introduction The ECM (ECCS control module) has an on board diagnostic system, which detects engine system malfunctions related to sensors or actuators. The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two Trip Detection Logic).

Two Trip Detection Logic

When a malfunction is detected for the first time, the malfunction (DTC and freeze frame data) is stored in the ECM memory. (1st trip) The malfunction indicator lamp will not light up at this stage.

If the same malfunction is detected during the next drive, this second detection causes the malfunction indicator lamp to light up. (2nd trip) Specific on board diagnostic items will light up or blink the MIL even in the 1st trip as below.

Items		MIL	
		1st trip	
		Lighting up	lighting up
Misfire (Possible three way catalyst damage)— DTC: P0300-P0304 (0701-0605) is being detected	X		
Misfire (Possible three way catalyst damage)— DTC: P0300-P0304 (0701-0605) has been detected		X	
Three way catalyst function — DTC: P0420 (0702)		Х	
Closed loop control — DTC: P0130 (0307)		X	
Except above			X

The "trip" in the "Two Trip Detection Logic" means performing of the "DTC Confirmation Procedure".

HOW TO READ DTC

Diagnostic Trouble Code (DTC)

The diagnostic trouble code can be read by the following methods. (Either code for the 1st trip or the 2nd trip can be read.)

- The number of blinks of the malfunction indicator lamp in the Diagnostic Test Mode II (Self-Diagnostic Results) Examples: 0101, 0201, 1003, 1104, etc.
 These DTCs are controlled by NISSAN.
- CONSULT or GST (Generic Scan Tool) Examples: P0340, P1320, P0705, P0750, etc. These DTCs are prescribed by SAE J2012. (CONSULT also displays the malfunctioning component or system.)
- Output of the trouble code means that the indicated circuit has a malfunction. However, in case of the Mode II and GST they do not indicate whether the malfunction is still occurring or occurred in the past and returned to normal.

CONSULT can identify them. Therefore, using CONSULT (if available) is recommended.

HOW TO ERASE DTC

The diagnostic trouble code can be erased by the following methods.

- Selecting "ERASE" in the "SELF DIAG RESULTS" mode with CONSULT.
- Selecting Mode 4 with GST (Generic Scan Tool).
- Changing the diagnostic test mode from Diagnostic Test Mode II to Mode I by turning the mode selector on the ECM. (Refer to EC-34.)
- If the battery terminal is disconnected, the diagnostic trouble code will be lost within 24 hours.
- When you erase the DTC, using CONSULT or GST is easier and quicker than switching the mode selector on the ECM.

HOW TO ERASE DTC (With CONSULT)

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 7 seconds and then turn it "ON" (engine stopped) again.
- 2. Turn CONSULT "ON" and touch "ENGINE".
- 3. Touch "SELF-DIAG RESULTS".
- 4. Touch "ERASE". (The DTC in the ECM will be erased.)

Diagnostic Trouble Code (DTC) (Cont'd)

HOW TO ERASE DTC (With GST)

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 7 seconds and then turn it "ON" (engine stopped) again.
- 2. Select Mode 4 with GST (Generic Scan Tool).

(NO TOOLS)

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 7 seconds and then turn it "ON" again.
- 2. Change the diagnostic test mode from Mode II to Mode I by turning the mode selector on the ECM. (See page EC-34.)

Freeze Frame Data

The ECM has a memory function which stores the driving condition at the moment the ECM detects a malfunction. This includes fuel system status, calculated load value, engine coolant temperature, short fuel trim, long fuel trim, engine speed, vehicle speed.

Stored data is called Freeze Frame Data.

The data is useful for tracking down conditions at the time of the malfunction. Such conditions include whether vehicle was running or stopped, engine warm up, air-fuel ratio, etc.

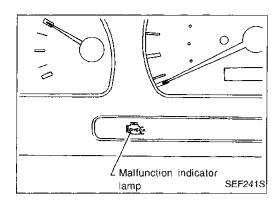

This data can be utilized to duplicate the malfunction and to diagnose the trouble.

The data will be erased along with the diagnostic trouble code by the above-mentioned method.

The data can be stored only for the 1st trip. It can not be renewed even at the 2nd trip. The freeze frame data can be stored for only one item. Therefore, the ECM has the following priorities to update the data.

Priority	Detected items
1	Misfires — DTC: P0300-P0304 (0701-0605) Fuel Injection System Function — DTC: P0172 (0114), P0171 (0115)
2	Except the above items

For example, an EGR malfunction (Priority: 2) was detected and the freeze frame data was stored at the 1st trip. After that, misfire (Priority: 1) is detected in another trip, and freeze frame data is updated from the EGR malfunction for the misfire.

Malfunction Indicator Lamp (MIL)

 The malfunction indicator lamp will light up when the ignition switch is turned ON without the engine running. This is a bulb check.

If the malfunction indicator lamp does not light up, refer to WARNING LAMPS AND CHIME in EL section (or see EC-296).

When the engine is started, the malfunction indicator lamp should go off.

If the lamp remains on, the on board diagnostic system has detected an engine system malfunction.

1_0

ON BOARD DIAGNOSTIC SYSTEM FUNCTION

The on board diagnostic system has the following four functions.

1. BULB CHECK

: This function checks the MIL bulb for damage (blown, open circuit, etc.).

2. MALFUNCTION WARNING

: This is a usual driving condition. When a malfunction is detected twice (two trip detection logic), the MIL will light up to inform the driver that a malfunction has been detected.

Only the following malfunctions with light up or blink the MIL even in the 1st trip.

"Misfire (Possible three way catalyst damage)"

• "Three way catalyst function"

"Closed loop control"

3. SELF-DIAGNOSTIC RESULTS

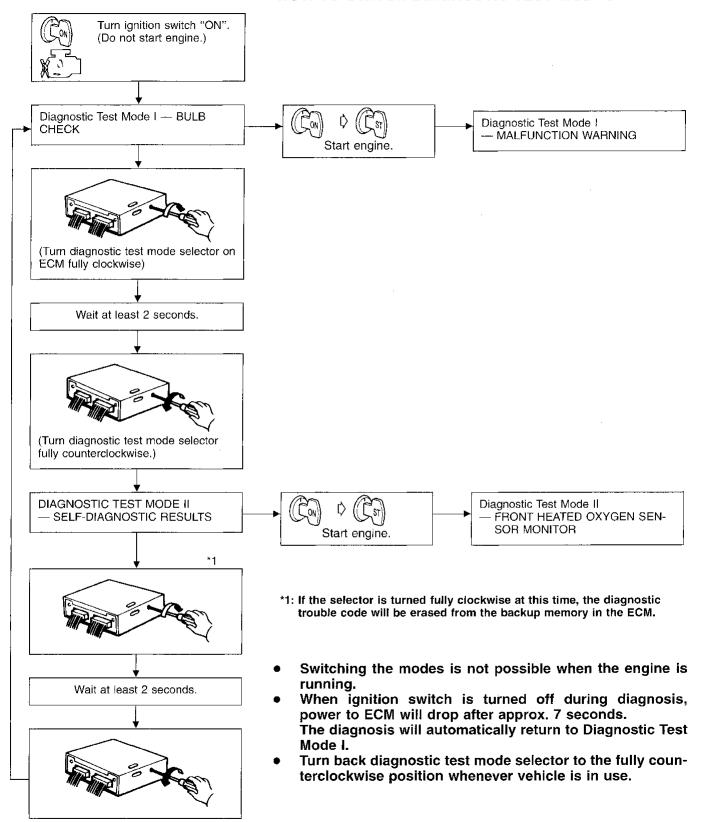

: This function allows diagnostic trouble codes to be read.

4. FRONT HEATED OXY-GEN SENSOR MONI-TOR : This function allows the fuel mixture condition (lean or rich), monitored by front heated oxygen sensor, to be read.

How to switch the diagnostic test (function) modes and details of the above functions are described later. (Refer to the next page.)

Co	ndition	Diagnostic Test Mode I	Diagnostic Test Mode II
Ignition switch	Engine stopped	BULB CHECK	SELF-DIAGNOSTIC RESULTS
tion	Engine running	MALFUNCTION WARNING	FRONT HEATED OXYGEN SENSOR MONITOR

Malfunction Indicator Lamp (MIL) (Cont'd) HOW TO SWITCH DIAGNOSTIC TEST MODES

Malfunction Indicator Lamp (MIL) (Cont'd)

DIAGNOSTIC TEST MODE I -- BULB CHECK

In this mode, the MALFUNCTION INDICATOR LAMP on the instrument panel should stay ON. If it remains OFF, check the bulb. (Refer to WARNING LAMPS AND CHIME in EL section or see EC-296.)

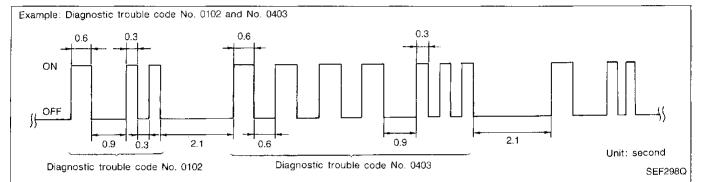

DIAGNOSTIC TEST MODE I — MALFUNCTION WARNING

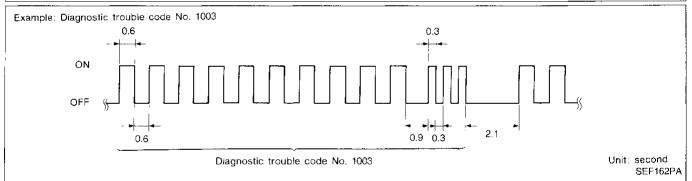

MALFUNCTION INDICATOR LAMP	Condition	
ON	When the malfunction is detected or the ECM's CPU is malfunctioning (The "1 trip" or "2 trip" is shown in the "MIL Illumination" of the "DTC Chart". Refer to EC-64).	
OFF	No malfunction	

 These Diagnostic Trouble Code Numbers are clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS).

DIAGNOSTIC TEST MODE II—SELF-DIAGNOSTIC RESULTS

In this mode, a diagnostic trouble code is indicated by the number of blinks of the MALFUNCTION INDICATOR LAMP as shown below.

Long (0.6 second) blinking indicates the two LH digits of number and short (0.3 second) blinking indicates the two RH digits of number. For example, the malfunction indicator lamp blinks 10 times for 6 seconds (0.6 sec \times 10 times) and then it blinks three times for about 1 second (0.3 sec \times 3 times). This indicates the DTC "1003" and refers to the malfunction of the park/neutral position switch.

In this way, all the detected malfunctions are classified by their diagnostic trouble code numbers. The DTC "0505" refers to no malfunction. (See Diagnostic Trouble Code (DTC) Chart, EC-64.)

HOW TO ERASE DIAGNOSTIC TEST MODE II (Self-diagnostic results)

The diagnostic trouble code can be erased from the backup memory in the ECM when the diagnostic test mode is changed from Diagnostic Test Mode II to Diagnostic Test Mode I. (Refer to "HOW TO SWITCH DIAGNOSTIC TEST MODES".)

- If the battery terminal is disconnected, the diagnostic trouble code will be lost from the backup memory within 24 hours.
- Be careful not to erase the stored memory before starting trouble diagnoses.

Malfunction Indicator Lamp (MIL) (Cont'd)

DIAGNOSTIC TEST MODE II — FRONT HEATED OXYGEN SENSOR MONITOR

In this mode, the MALFUNCTION INDICATOR LAMP displays the condition of the fuel mixture (lean or rich) which is monitored by the front heated oxygen sensor.

MALFUNCTION INDICATOR LAMP	Fuel mixture condition in the exhaust gas	Air fuel ratio feedback control condition
ON	Lean	Classed lean gustam
OFF	Rich	Closed loop system
*Remains ON or OFF	Any condition	Open loop system

^{*:} Maintains conditions just before switching to open loop.

To check the front heated oxygen sensor function, start engine in the Diagnostic Test Mode II and warm it up until engine coolant temperature indicator points to the middle of the gauge.

Next run engine at about 2,000 rpm for about 2 minutes under no-load conditions. Then make sure that the MALFUNCTION INDICATOR LAMP comes ON more than 5 times within 10 seconds with engine running at 2,000 rpm under no-load.

OBD System Operation Chart

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the DTC and the freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the MIL will come on. For details, refer
 to "Two Trip Detection Logic" on EC-31.
- The MIL will go off after the vehicle is driven 3 times with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset. The MIL will remain on until the vehicle is driven (in the recorded driving pattern) 3 times with no malfunction.
- The DTC and the freeze frame data can be displayed until the vehicle is driven 40 times (except for Misfire and Fuel Injection System, the DTC and freeze frame data can be displayed until the vehicle is driven 80 times. The "TIME" IN "SELF-DIAGNOSTIC RESULTS" mode of CONSULT will count in response to the number of times the vehicle is driven.

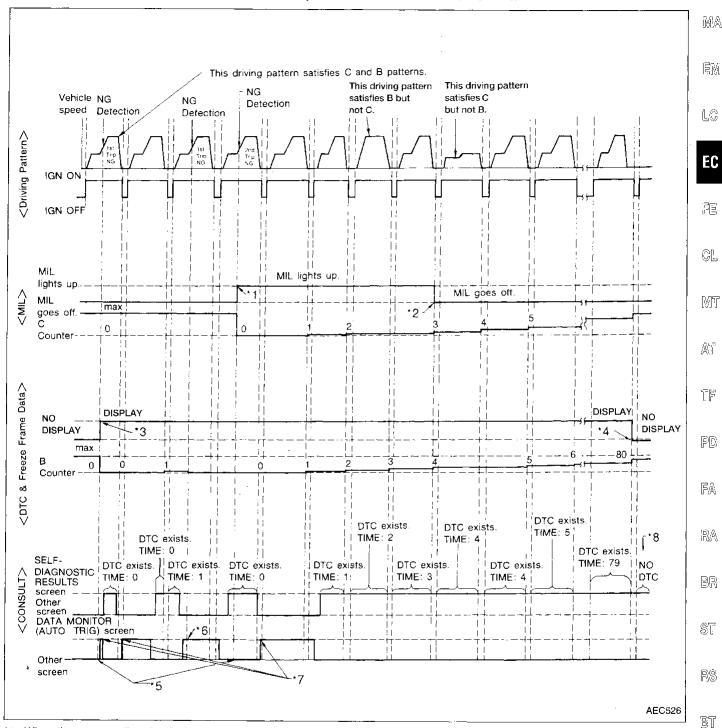

SUMMARY CHART

Items	MIL (goes off)	DTC, Freeze Frame Data (no display)
Fuel Injection System	3 (pattern C)	80 (pattern B)
Misfire	3 (pattern C)	80 (pattern B)
Except the above	3 (pattern B)	40 (pattern A)

Details about patterns "A", "B", and "C" are on EC-38.

OBD System Operation Chart (Cont'd)

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DRIVING PATTERNS FOR "MISFIRE" <EXHAUST QUALITY DETERIORATION>, "FUEL INJECTION SYSTEM"

- *1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- *2: MIL will go off after vehicle is driven 3 times (pattern C) without any malfunctions.
- *3: When a malfunction is detected for the first time, the DTC and the freeze frame data will be stored in ECM.
- *4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern B) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)
- *5: Other screen except DATA MONITOR (AUTO TRIG) can not display the malfunction.

- *6: DATA MONITOR (AUTO TRIG) can display the malfunction at the moment it is detected.
- *7: The malfunction can not be displayed because the timing to set DATA MONITOR (AUTO TRIG) screen was missed against the NG detection.
- *8: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern B) without the same malfunction.

(The DTC and the freeze frame data still remain in ECM.)

MA

@[

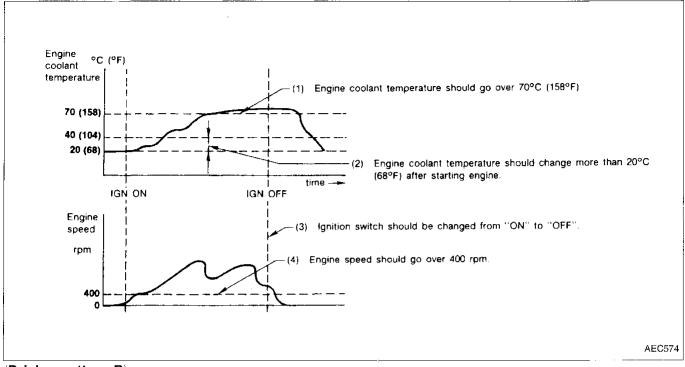

EC

ID)X(

OBD System Operation Chart (Cont'd)

EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

(Driving pattern A)

(Driving pattern B)

Driving pattern B means the vehicle operation as follows:

All components and systems should be monitored at least once by the OBD system.

- The B counter will reset when the malfunction is detected twice regardless of the driving pattern.
- The B counter will count the number of times driving pattern B is satisfied without the malfunction.
- The DTC will not be displayed after the B counter reaches 80.

(Driving pattern C)

Driving pattern C means the vehicle operation as follows:

- (1) Driving pattern A should be satisfied.
- (2) The following conditions should be satisfied at the same time: Engine speed: (Engine speed in the freeze frame data) ±375 rpm Calculated load value: (Calculated load value in the freeze frame data) x (1±0.1) [%] Engine coolant temperature (T) condition:
- When the freeze frame data shows lower than 70°C (158°F), "T" should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), "T" should be higher than or equal to 70°C (158°F).

Example:

If the stored freeze frame data is as follows:

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)

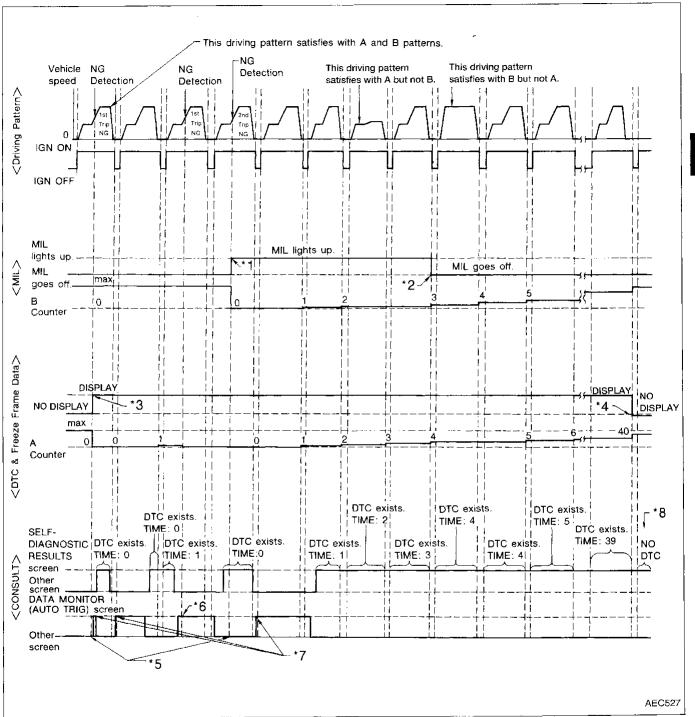

To be satisfied with driving pattern C, the vehicle should run under the following conditions:

Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than >70°C (158°F)

- The C counter will be cleared when the malfunction is detected regardless of (1), (2). (*1 in "OBD SYSTEM OPERATION CHART")
- The C counter will be counted up when (1), (2) are satisfied without the same malfunction.
- The MIL will go off when the C counter reaches 3. (*2 in "OBD SYSTEM OPERATION CHART")

OBD System Operation Chart (Cont'd)

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DRIVING PATTERNS EXCEPT FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

- *1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- *2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.
- *3: When a malfunction is detected for the first time, the DTC and the freeze frame data will be stored in ECM.
- *4: The DTC and the freeze frame data will not be displayed after vehicle is driven 40 times (pattern A) without the same malfunction.
 - (The DTC and the freeze frame data still remain in ECM.)
- *5: Other screen except DATA MONITOR (AUTO TRIG) can not display the malfunction.

- *6: DATA MONITOR (AUTO TRIG) can display the malfunction at the moment it is detected.
- *7: The malfunction can not be displayed because the timing to set DATA MONITOR (AUTO TRIG) screen was missed against the NG detection.
- *8: The DTC and the freeze frame data will not be displayed after vehicle is driven 40 times (pattern A) without the same malfunction.

(The DTC and the freeze frame data still remain in ECM.)

SELF-DIAGNOSTIC MODE

Regarding items detected in "SELF-DIAG RESULTS" mode, refer to "Diagnostic Trouble Code (DTC) chart" (See page EC-64.)

DATA MONITOR MODE

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
CMPS-RPM (POS) [rpm]	0	0	 Indicates the engine speed computed from the POS signal (1° signal) of the camshaft position sensor. 	
CMPS·RPM (REF) [rpm]	0		 Indicates the engine speed computed from the REF signal (180° signal) of the camshaft position sensor. 	 The accuracy of detection becomes poor if engine speed drops below the idle rpm. If the signal is interrupted while the engine is running, an abnormal value may be indicated.
MAS AIR/FL SE [V]	0	0	 The signal voltage of the mass air flow sensor is displayed. 	When the engine is stopped, a certain value is indicated.
COOLAN TEMP/S [°C] or [°F]	0	0	 The engine coolant temperature (determined by the signal voltage of the engine coolant temperature sensor) is displayed. 	 When the engine coolant temperature sensor is open or short-circuited, ECM enters fail-safe mode. The engine cool- ant temperature determined by the ECM is displayed.
FR O2 SENSOR [V]	\bigcirc	\bigcirc	 The signal voltage of the front heated oxygen sensor is displayed. 	
RR O2 SENSOR [V]	0	\bigcirc	 The signal voltage of the rear heated oxygen sensor is displayed. 	
FR O2 MNTR [RICH/LEAN]	0	0	 Display of front oxygen sensor signal during air-fuel ratio feedback control: RICH means the mixture became "rich", and control is being affected toward a leaner mixture. LEAN means the mixture became "lean", and control is being affected toward a rich mixture. 	 After turning ON the ignition switch, "RICH" is displayed until air-fuel mixture ratio feedback control begins. When the air-fuel ratio feedback is clamped, the value just before the clamping is displayed continuously.
RR O2 MNTR [RICH/LEAN]	0		Display of rear heated oxygen sensor signal: RICH means the amount of oxygen downstream three way catalyst is relatively large. LEAN means the amount of oxygen downstream three way catalyst is relatively small.	When the engine is stopped, a certain value is indicated.
VHCL SPEED SE [km/h] or [mph]	0	\bigcirc	The vehicle speed computed from the vehicle speed sensor signal is displayed.	

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

			CONSULT (Cont'd)	
Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
BATTERY VOLT [V]	0	0	 The power supply voltage of ECM is dis- played. 	
THRTL POS SEN [V]	0	0	The throttle position sensor signal voltage is displayed.	
TANK F/TMP SE [°C] or [°F]	0		The fuel temperature judged from the tank fuel temperature sensor signal voltage is displayed.	
EGR TEMP SEN [V]	0		 The signal voltage of the EGR tempera- ture sensor is displayed. 	
INT/A TEMP SE [°C] or [°F]	0		 The intake air temperature determined by the signal voltage of the intake air tem- perature sensor is indicated. 	
START SIGNAL [ON/OFF]	0	0	 Indicates [ON/OFF] condition from the starter signal. 	 After starting the engine, [OFF] is dis- played regardless of the starter signal.
CLSD THL/P SW [ON/OFF]	0	0	 Indicates [ON/OFF] condition from the closed throttle position switch signal. 	
AIR COND SIG [ON/OFF]	0	0	 Indicates [ON/OFF] condition of the air conditioner switch as determined by the air conditioner signal. 	
P/N POSI SW [ON/OFF]	0	0	 Indicates [ON/OFF] condition from the park/neutral position switch signal. 	
PW/ST SIGNAL [ON/OFF]	0	0	 [ON/OFF] condition of the power steering oil pressure switch determined by the power steering oil pressure signal is indi- cated. 	
IGNITION SW [ON/OFF]	0		 Indicates [ON/OFF] condition from ignition switch. 	
SWL CON VC SW [ON/OFF]	0		 Indicates [ON/OFF] condition of swirl control valve control vacuum check switch determined by ECM according to the input signal. ON Atmospheric pressure OFF Vacuum pressure 	
INJ PULSE [msec]	:	0	 Indicates the actual fuel injection pulse width compensated by ECM according to the input signals. 	When the engine is stopped, a certain computed value is indicated.
B/FUEL SCHDL [msec]		0	 "Base fuel schedule" indicates the fuel injection pulse width programmed into ECM, prior to any learned on-board cor- rection.

EC-51 191

CONSULT (Cont'd) FREEZE FRAME DATA OF SELF-DIAGNOSTIC RESULTS MODE

Freeze frame data item	Description			
DIAG TROUBLE CODE [PXXXX]	 ECCS component part/control system has a trouble code, it is displayed as "PXXXX". [Refer to "Alphabetical & P No. Index for DTC (EC-297).] 			
FUEL SYS DATA	 "Fuel injection system status" at the moment a malfunction is detected is displayed. One mode in the following is displayed. "MODE 2": Open loop due to detected system malfunction "MODE 3": Open loop due to driving conditions (power enrichment, deceleration enrichment) "MODE 4": Closed loop - using oxygen sensor(s) as feedback for fuel control "MODE 5": Open loop - has not yet satisfied condition to go to closed loop 			
CAL/LD VALUE [%]	The calculated load value at the moment a malfunction is detected is displayed.			
COOLANT TEMP [°C] or [°F]	The engine coolant temperature at the moment a malfunction is detected is displayed.			
S-FUEL TRIM [%]	 "Short-term fuel trim" at the moment a malfunction is detected is displayed. The short-term fuel trim indicates dynamic or instantaneous feedback compensation to the base fuel schedule. 			
"Long-term fuel trim" at the moment a malfunction is detected is displayed. L-FUEL TRIM [%] "Long-term fuel trim" at the moment a malfunction is detected is displayed. The long-term fuel trim indicates much more gradual feedback compensation to the base than short-term fuel trim.				
ENGINE SPEED [rpm]	The engine speed at the moment a malfunction is detected is displayed.			
VHCL SPEED [km/h] or [mph]	The vehicle speed at the moment a malfunction is detected is displayed.			
ABSOL PRES [kPa] or [kg/cm²] or [Psi]	The intake manifold absolute pressure at the moment a malfunction is detected is displayed.			

CONSULT (Cont'd)

REAL TIME DIAGNOSIS IN DATA MONITOR MODE

CONSULT has two kinds of triggers and they can be selected by touching "SETTING" in "DATA MONITOR" mode.

- 1. "AUTO TRIG" (Automatic trigger):
 - The malfunction will be identified on the CONSULT screen in real time.

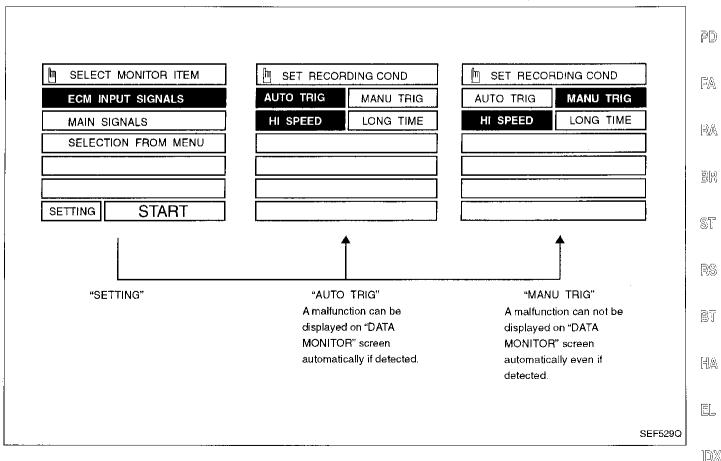

In other words, DTC and malfunction item will be displayed at the moment the malfunction is detected by ECM.

DATA MONITOR can be performed continuously until a malfunction is detected. However, DATA MONITOR cannot continue any longer after the malfunction detection.

- 2. "MANU TRIG" (Manual trigger):
 - DTC and malfunction item will not be displayed automatically on CONSULT screen even though a malfunction is detected by ECM.
 - DATA MONITOR can be performed continuously even though a malfunction is detected.

Use these triggers as follows:

- "AUTO TRIG"
 - While trying to detect the DTC by performing the "DTC CONFIRMATION PROCEDURE", be sure to select to "DATA MONITOR (AUTO TRIG)" mode. You can confirm the malfunction at the moment it is detected.
 - While narrowing down the possible causes, CONSULT should be set in "DATA MONITOR (AUTO TRIG)" mode, especially in case the incident is intermittent.
 When you are inspecting the circuit by gently shaking (or twisting) the suspicious connectors, components and harness in the "DTC CONFIRMATION PROCEDURE", the moment a malfunction is found the DTC will be displayed. (Refer to GI section, "Incident Simulation Tests" in "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".)
- 2. "MANU TRIG"
 - If the malfunction is displayed as soon as "DATA MONITOR" is selected, reset CONSULT to "MANU TRIG". By selecting "MANU TRIG" you can monitor and store the data. The data can be utilized for further diagnosis, such as a comparison with the value for the normal operating condition.

Generic Scan Tool (GST) DESCRIPTION

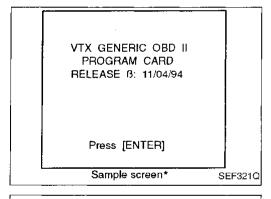

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has five different functions explained on the next page. ISO9141 is used as the protocol.

The name "GST" or "Generic Scan Tool" is used in this service manual.

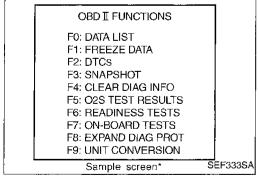

GST INSPECTION PROCEDURE

- Turn off ignition switch.
- Connect "GST" to data link connector for GST. (Data link connector for GST is located under LH dash panel near the fuse box cover.)

- Turn ON ignition switch.
- 4. Enter the program according to instruction on the screen or in the operation manual.
- (*: Regarding GST screens in this section, sample screens are shown.)

Perform each diagnostic mode according to each service procedure.

For further information, see the GST Operation Manual of the tool maker.

Generic Scan Tool (GST) (Cont'd)

FUNCTION

Diagnostic test mode		Function
MODE 1	(DATA LIST)	This mode accesses to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.
MODE 2	(FREEZE DATA)	This mode accesses to emission-related data value which were stored by ECM during the freeze frame. [For details, refer to "Freeze frame data of self-diagnostic results mode" (EC-52).]
MODE 3	(DTCS)	This mode accesses to emission-related power train trouble codes which were stored by ECM.
MODE 4	(CLEAR DIAG INFO)	This mode can clear all emission-related diagnostic information. This includes: Clear number of diagnostic trouble codes (MODE 1) Clear diagnostic trouble codes (MODE 3) Clear trouble code for freeze frame data (MODE 1) Clear freeze frame data (MODE 2) Clear heated oxygen sensor test data (MODE 5) Reset status of system monitoring test (MODE 1)
MODE 5	(O2S TEST RESULTS)	This mode accesses to the on board heated oxygen sensor monitoring test results.

TROUBLE DIAGNOSIS — Introduction

Introduction

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no problems such as vacuum leaks, fouled spark plugs, or other problems with the engine.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or improper wiring. In this case, careful checking of suspected circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the problems. A road test with CONSULT (or GST) or a circuit tester connected should be performed. Follow the "Work Flow" on the next page.

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such problems, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A "Diagnostic Worksheet" like the example on the next page should be used.

Start your diagnosis by looking for "conventional" problems first. This will help troubleshoot driveability problems on an electronically controlled engine vehicle.

TROUBLE DIAGNOSIS — Introduction

KEY POINTS

WHAT Vehicle & engine model WHEN Date, Frequencies WHERE Road conditions HOW Operating conditions, Weather conditions, Symptoms

SEF907L

Diagnostic Worksheet

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make trouble-shooting faster and more accurate.

In general, each customer feels differently about a problem. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one shown below in order to organize all the information for troubleshooting.

WORKSHEET SAMPLE

Customer name MR/MS Engine #		Model & Year VIN					
		Trans. Mileage					
Incident Date	;	Manuf. Date In Service Date					
	☐ Startability	☐ Impossible to start ☐ No combustion ☐ Partial combustion ☐ Partial combustion affected by throttle position ☐ Partial combustion NOT affected by throttle position ☐ Possible but hard to start ☐ Others []					
Cumptomo	□ Idling	☐ No fast idle ☐ Unstable ☐ High idle ☐ Low idle ☐ Others [
Symptoms	☐ Driveability	☐ Stumble ☐ Surge ☐ Knock ☐ Lack of power ☐ Intake backfire ☐ Exhaust backfire ☐ Others []					
	☐ Engine stall	☐ At the time of start ☐ While idling ☐ While accelerating ☐ Ust after stopping ☐ While loading					
Incident occu	irrence	☐ Just after delivery ☐ Recently ☐ In the morning ☐ At night ☐ In the daytime					
Frequency		☐ All the time ☐ Under certain conditions ☐ Sometimes					
Weather con	ditions	□ Not affected					
•	Weather	□ Fine □ Raining □ Snowing □ Others []					
	Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Cold ☐ Humid °F					
Engine conditions		□ Cold □ During warm-up □ After warm-up Engine speed □ , , , , , , , , , , , , , , , , , ,					
Road conditions		☐ In town ☐ In suburbs ☐ Highway ☐ Off road (up/down)					
Driving conditions		□ Not affected □ At starting □ While idling □ At racing □ While accelerating □ While cruising □ While decelerating □ While turning (RH/LH) Vehicle speed □ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □ □					
Malfunction in	ndicator lamp	☐ Turned on ☐ Not turned on

^{*1:} If the incident cannot be duplicated, see "Incident Simulation Tests" of "HOW TO PERFORM EFFICIENT DIAGNO-SIS FOR AN ELECTRICAL INCIDENT" in GI section.

^{*2:} If the on-board diagnostic system cannot be performed, check main power supply and ground circuit (See TROUBLE DIAGNOSIS FOR POWER SUPPLY EC-91).

TROUBLE DIAGNOSIS — Work Flow

STEP	DESCRIPTION
STEP I	Get detailed information about the conditions and the environment when the incident/symptom occurred using the "DIAGNOSTIC WORK SHEET" as shown on the next page.
STEP il	Before confirming the concern, check and write down (print out using CONSULT or Generic Scan Tool) the Diagnostic Trouble Code (DTC) and the freeze frame data, then erase the code and the data. (Refer to EC-31.) The DTC and the freeze frame data can be used when duplicating the incident at STEP III & IV. Study the relationship between the cause, specified by DTC, and the symptom described by the customer. (The "Symptom Matrix Chart" will be useful. See page EC-79.)
STEP III	Try to confirm the symptom and under what conditions the incident occurs. The "DIAGNOSTIC WORK SHEET" and the freeze frame data are useful to verify the incident. Connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) If the malfunction code is detected, skip STEP IV and perform STEP V.
STEP IV	Try to detect the Diagnostic Trouble Code (DTC) by driving in (or performing) the "DTC CONFIRMATION PROCEDURE". Check and read the DTC and freeze frame data by using CONSULT or Generic Scan Tool. During the DTC verification, be sure to connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) In case the "DTC CONFIRMATION PROCEDURE" is not available, perform the "OVERALL FUNCTION CHECK" instead. The DTC cannot be displayed by this check, however, this simplified "check" is an effective alternative. The "NG" result of the "OVERALL FUNCTION CHECK" is the same as the DTC detection.
STEP V	Take the appropriate action based on the results of STEP I through IV. If the malfunction code is indicated, proceed to TROUBLE DIAGNOSIS FOR DTC PXXXX. If the normal code is indicated, proceed to the BASIC INSPECTION on next page. Then perform inspections according to the Symptom Matrix Chart. (Refer to EC-79.)
STEP VI	Identify where to begin diagnosis based on the relationship study between symptom and possible causes. Inspect the system for mechanical binding, loose connectors or wiring damage using (tracing) "Harness Layouts". Gently shake the related connectors, components or wiring harness with CONSULT set in "DATA MONITOR (AUTO TRIG)" mode. Check the voltage of the related ECM terminals or monitor the output data from the related sensors with CONSULT. Refer to EC-81. The "DIAGNOSTIC PROCEDURE" in EC section contains a description based on open circuit inspection. A short circuit inspection is also required for the circuit check in the DIAGNOSTIC PROCEDURE. For details, refer to GI section ("HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT", "Circuit Inspection"). Repair or replace the malfunction parts.
STEP VII	Once you have repaired the circuit or replaced a component, you need to run the engine in the same conditions and circumstances which resulted in the customer's initial complaint. Perform the "DTC CONFIRMATION PROCEDURE" and confirm the normal code (Diagnostic trouble code No. 0505 or P0000) is detected. If the incident is still detected in the final check, perform STEP VI by using a different method from the previous one. Before returning the vehicle to the customer, be sure to erase the unnecessary (already fixed) DTC in ECM. (Refer

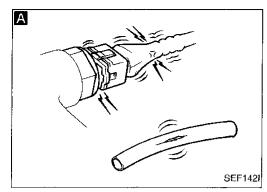

199

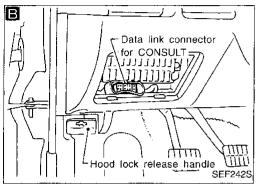

R\$

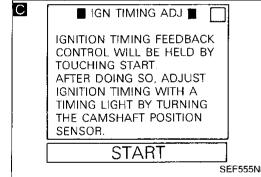

F

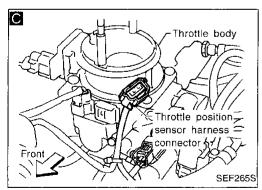

DX

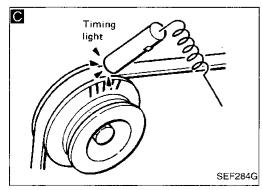

to EC-31.)

Basic Inspection

Precaution:

Perform Basic Inspection without electrical or mechanical loads applied;

Go to 🔳 .

sensor.

Adjust ignition timing by

turning camshaft position

NG

- Headlamp switch is OFF,
- Air conditioner switch is OFF,
- Rear defogger switch is OFF,
- Steering wheel is in the straight-ahead position, etc.

Α

BEFORE STARTING

- Check service records for any recent repairs that may indicate a related problem, or the current need for scheduled maintenance.
- Open engine hood and check the following:
- Harness connectors for improper connections
- Vacuum hoses for splits, kinks, or improper connections
- Wiring for improper connections, pinches, or cuts

В

CONNECT CONSULT TO THE VEHICLE.

Connect "CONSULT" to the data link connector for CONSULT and select "ENGINE" from the menu. (Refer to page EC-41.)

DOES ENGINE START?
Yes

CHECK IGNITION TIMING.

- Warm up engine sufficiently.
- Select "IGN TIMING ADJ" in "WORK SUPPORT" mode.
- 3. Touch "START"
- Check ignition timing at idle using timing light.

Ignition timing:

M/T 10°±2° BTDC A/T 10°±2° BTDC (in "N" position)

- Warm up engine sufficiently.
 Stop engine and disconnect
 - throttle position sensor harness connector.
 - 3. Start engine.
 - Check ignition timing at idle using timing light.

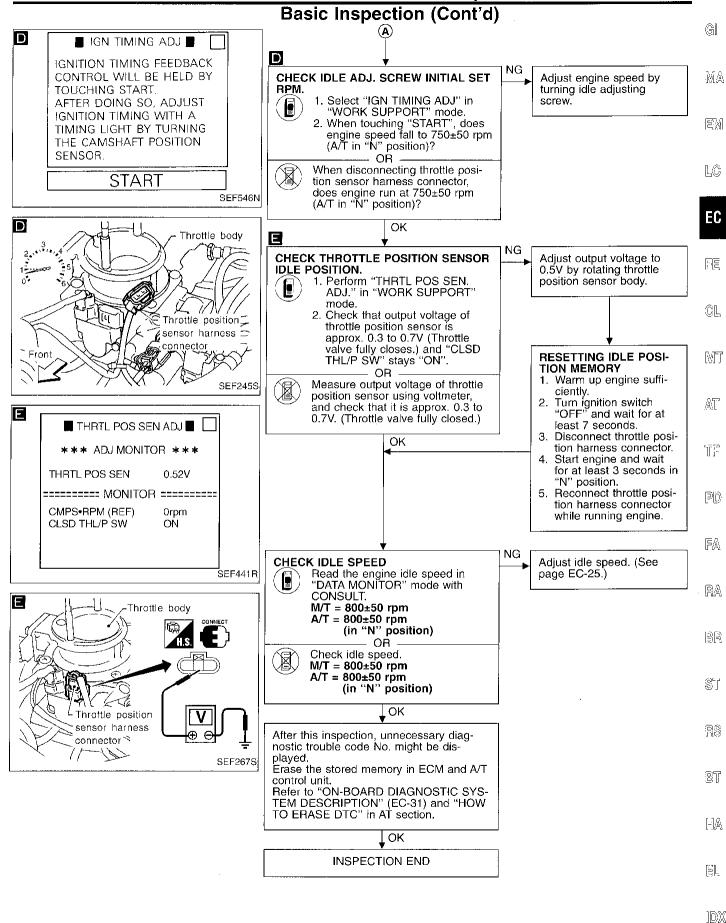

Ignition timing:

M/T 10°±2° BTDC A/T 10°±2° BTDC (in "N" position)

▼ OK

(Go to (A) on next page.)

TROUBLE DIAGNOSIS — Basic Inspection

NOTE

Diagnostic Trouble Code (DTC) Chart

INSPECTION PRIORITY

If some DTCs are displayed at the same time, perform inspections one by one based on the following priority chart.

Priority	Detected items (DTC)						
1	● ECM (P0605, 0301)	 Camshaft position sensor circuit (P0340, 0101) 	 Engine coolant temperature sensor circuit (P0115, 0103) (P0125, 0908) 				
	 Mass air flow sensor circuit (P0100, 0102) 	 Vehicle speed sensor circuit (P0500, 0104) 	● Ignition signal circuit (P1320, 0201)				
	 Throttle position sensor circuit (P0120, 0403) 	 Intake air temperature sensor cir- cuit (P0110, 0401) 	 Park/Neutral position switch circuit (P0705, 1003) 				
	 EGRC-solenoid valve circuit (P1400, 1005) 	 Tank fuel temperature sensor (P0180, 0402) 					
2	● EGR temperature sensor circuit (P1401, 0305)	 Crankshaft position sensor circuit (P0335, 0802), (P1336, 0905) 	 Front heated oxygen sensor circuit (P0130, 0303) 				
	 Absolute pressure sensor circuit (P0105, 0803) 	 Front heated oxygen sensor heater circuit (P0135, 0901) 	 Rear heated oxygen sensor circuit (P0136, 0707) 				
	 MAP/BARO switch solenoid valve circuit (P1105, 1302) 	 EVAP control system pressure sensor circuit (P0450, 0704) 	 EVAP canister purge volume con- trol valve circuit (P1445, 1008) 				
	 EVAP canister purge control valve/ solenoid valve circuit (P0443, 0807) 	 EVAP canister vent control valve circuit (P0446, 0903) 	 EVAP control system purge flow monitoring (P1447, 0111) 				
	 Vacuum cut valve bypass valve (P1441, 0801) 	● T/C clutch solenoid valve (P1550, 0904)	 Closed throttle position switch circuit (P0510, 0203) 				
	 Rear heated oxygen sensor heater circuit (P0141, 0902) 	 Swirl control valve control vacuum check switch (P1165, 0112) 					
3	● EGR function (P0400, 0302)	• Misfire (P0300 - P0304, 0701 - 0605)	• Fuel injection system function (P0172, 0114), (P0171, 0115)				
	● EGRC-BPT valve function (P0402, 0306)	 Closed loop control (P0130, 0307) 	Three way catalyst function (P0420, 0702)				
	● IACV-AAC valve circuit (P0505, 0205)		EVAP control system (small leak) (P0440, 0705)				
	 Swirl control valve control solenoid valve (P1130, 1004)

Diagnostic Trouble Code (DTC) Chart (Cont'd)

ENGINE RELATED ITEMS

Diagnostic trouble code No.		Detected items (Screen terms for	Malfunction is detected when
CONSULT GST	MIL	CONSULT, "SELF-DIAG RESULTS" mode)	
(P0000)	0505	No failure (NO SELF DIAGNOSTIC FAILURE INDICATED)	No malfunction related to OBD system is detected by ECM.
P0100	0102	Mass air flow sensor cir- cuit (MASS AIR FLOW SEN)	 An excessively high or low voltage is entered to ECM. Voltage sent to ECM is not practical when compared with the camshaft position sensor signal and throttle position sensor signals.
P0105	0803	Absolute pressure sensor (ABSOL PRESS SEN- SOR)	● An excessively low or high voltage from the sensor is sent to ECM.
			 A low voltage from the sensor is sent to ECM under heavy load driving conditions.
			 A high voltage from the sensor is sent to ECM under light load driving conditions.
P0110	0401	Intake air temperature sensor circuit (INT AIR TEMP SEN)	• An excessively low or high voltage from the sensor is detected by the ECM.
			 Voltage sent to ECM is not practical when compared with the engine coolant temperature sensor signal.
P0115	0103	Engine coolant tempera- ture sensor circuit (COOLANT TEMP SEN)	• An excessively high or low voltage from the sensor is detected by the ECM.
P0120	0403	Throttle position sensor circuit (THROTTLE POSI SEN)	 An excessively low or high voltage from the sensor is detected by the ECM. Voltage sent to ECM is not practical when compared with the mass air flow sensor and camshaft position sensor signals.
P0125	0908	Engine coolant tempera- ture sensor function (*COOLANT TEMP SEN)	 Voltage sent to ECM from the sensor is not practical, even when some time has passed after starting the engine. Engine coolant temperature is insufficient for closed loop fuel control.

Note: A dead (weak) battery will reduce the accuracy of the on board diagnosis and may cause the MIL to light up without any malfunctions.

Abbreviations for Quick Reference of "DTC CONFIRMATION PROCEDURE"

IGN: ON : Turning the ignition switch ON is required for checking the function of the sensor, switch, solenoid and circuit.

RUNNING: Running engine is required for checking the function of the sensor, switch, solenoid and circuit.

LIFTING : Lifting up the vehicle, running engine and spinning wheels are required.

DRIVING : Driving the vehicle in the specified pattern is required.

Abbreviations for Quick Reference of "OVERALL FUNCTION CHECK"

IGN: ON : Turning the ignition switch ON is required for the ECM to detect a malfunction (if one exists).

RUNNING: Running engine is required for the ECM to detect a malfunction (if one exists).

LIFTING : Lifting up the vehicle, running engine and spinning wheels are required for the ECM to detect a malfunction (if one

exists).

P0130	0303	Front heated oxygen sensor circuit (FRONT O2 SENSOR)	 An excessively high voltage from the sensor is detected by the ECM. The voltage from the sensor is constantly approx. 0.3V. The specified maximum and minimum voltages from the sensor are not reached. It takes more than the specified time for the sensor to respond between rich and lean. 				
P0130	0307	Closed loop control (CLOSED LOOP)	 The closed loop control function does not operate even when vehicle is driving in the specified condition. 				
P0135	0901	Front heated oxygen sen- sor heater circuit (FR O2 SEN HEATER)	The current amperage in the heater circuit is out of the normal range. (An improper voltage drop signal is sent to ECM through the heater.)				
P0136	0707	Rear heated oxygen sensor circuit (REAR O2 SENSOR)	 An excessively high voltage from the sensor is detected by the ECM. The specified maximum and minimum voltages from the sensor are not reached. It takes more than the specified time for the sensor to respond between rich and lean. 				
P0141	0902	Rear heated oxygen sen- sor heater (RR O2 SEN HEATER)	 The current amperage in the heater circuit is out of the normal range. (An improper voltage drop signal is sent to ECM through the heater.) 				
P0171	0115	Fuel injection system func- tion (FUEL SYS DIAG-LEAN)	 Fuel injection system does not operate properly. The amount of mixture ratio compensation is too large. (The mixture ratio is too lean.) 				
P0172	0114	Fuel injection system function (FUEL SYS DIAG-RICH)	 Fuel injection system does not operate properly. The amount of mixture ratio compensation is too large. (The mixture ratio is too rich.) 				
P0180	0402	Tank fuel temperature sensor circuit (TANK FUEL TEMP SEN)	 An excessively low or high voltage from the sensor is sent to ECM. Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signal from engine coolant temperature sensor and intake air temperature sensor. 				

Note: A dead (weak) battery will reduce the accuracy of the on board diagnosis and may cause the MIL to light up without any malfunctions.

Abbreviations for Quick Reference of "DTC CONFIRMATION PROCEDURE"

IGN: ON : Turning the ignition switch ON is required for checking the function of the sensor, switch, solenoid and circuit.

RUNNING: Running engine is required for checking the function of the sensor, switch, solenoid and circuit.

LIFTING: Lifting up the vehicle, running engine and spinning wheels are required.

DRIVING : Driving the vehicle in the specified pattern is required.

Abbreviations for Quick Reference of "OVERALL FUNCTION CHECK"

IGN: ON : Turning the ignition switch ON is required for the ECM to detect a malfunction (if one exists).

RUNNING: Running engine is required for the ECM to detect a malfunction (if one exists).

LIFTING : Lifting up the vehicle, running engine and spinning wheels are required for the ECM to detect a malfunction (if one

exists).

CONSULT Reference Value in Data Monitor Mode

Remarks:

- Specification data are reference values.
- Specification data are output/input values which are detected or supplied by the ECM at the connector.
 - * Specification data may not be directly related to their components signals/values/operations.
 - i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.
- If the real-time diagnosis results are NG and the on board diagnostic system results are OK when diagnosing the mass air flow sensor, first check to see if the fuel pump control circuit is normal.

Major Sensor Reference Graph in Data Monitor Mode

The following are the major sensor reference graphs in "DATA MONITOR" mode. (Select "HI SPEED" in "DATA MONITOR" with CONSULT.)

THRTL POS SEN, ABSOL TH:P/S, CLSD THL/P SW

Below is the data for "THRTL POS SEN", "ABSOL TH:P/S" and "CLSD THL/P SW" when depressing the accelerator pedal with the ignition switch "ON".

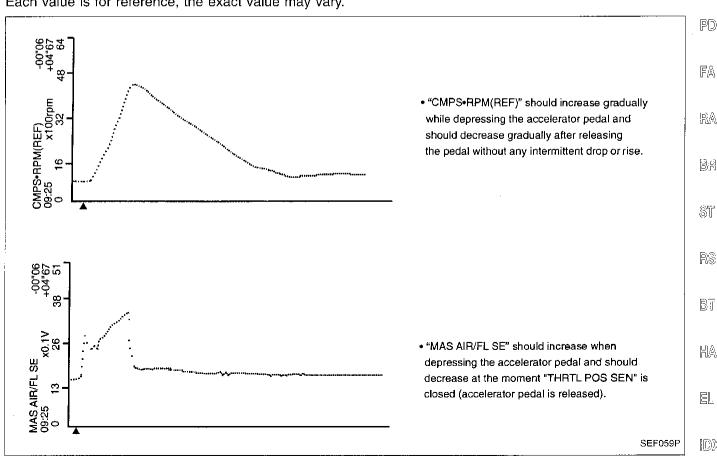

The signal of "THRTL POS SEN" and "ABSOL TH-P/S" should rise gradually without any intermittent drop or rise after "CLSD THL/P SW" is changed from "ON" to "OFF".

CMPS·RPM (REF), MAS AIR/FL SE, THRTL POS SEN, RR O2 SENSOR, FR O2 SENSOR, INJ **PULSE**

Below is the data for "CMPS-RPM (REF)", "MAS AIR/FL SE", "THRTL POS SEN", "RR O2 SENSOR", "FR O2 SENSOR" and "INJ PULSE" when revving quickly up to 4,800 rpm under no load after warming up engine sufficiently.

Each value is for reference, the exact value may vary.

TROUBLE DIAGNOSIS FOR POWER SUPPLY

TROUBLE DIAGNOSIS FOR POWER SUPPLY

Mass Air Flow Sensor (MAFS) (DTC: 0102)

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. It consists of a hot wire that is supplied with electric current from the ECM. The temperature of the hot wire is controlled by the ECM a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the ECM must supply more electric current to the hot wire as air flow increases. This maintains the temperature of the hot wire. The ECM detects the air flow by means of this current change.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Item (Possible Cause)
P0100 0102	A) An excessively high or low voltage from the sensor is sent to ECM. B)C) Rationally incorrect voltage is sent to ECM, compared with the calculated value by camshaft position sensor signal and throttle position sensor signal.	Harness or connectors (The sensor circuit is open or shorted.) Mass air flow sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION **PROCEDURE**

Perform "Procedure for malfunction A" first. If the DTC cannot be confirmed, perform "Procedure for malfunction B". If there is no problem on "Procedure for malfunction B", perform "Procedure for malfunction C", "OVERALL FUNCTION CHECK".

Procedure for malfunction A

(SF)

1)

- Turn ignition switch "ON" and wait at least 6 seconds.
- Select "DATA MONITOR" mode with CONSULT.
- Start engine and wait at least 3 seconds.

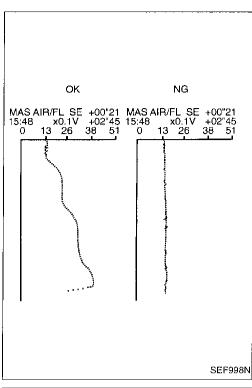

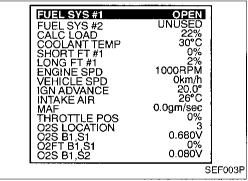

- OR Turn ignition switch "ON" and wait at least 6 seconds.
- Start engine and wait at least 3 seconds.
- Select "MODE 3" with GST.

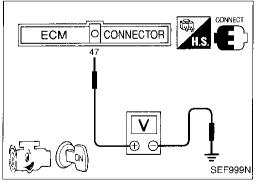

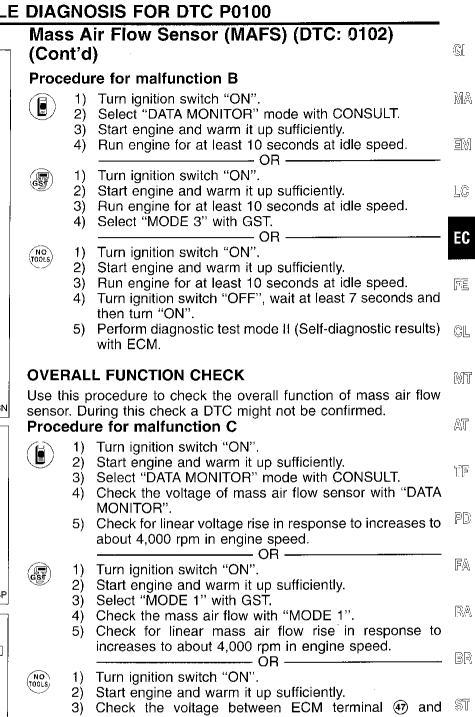

- 1) Turn ignition switch "ON" and wait at least 6 seconds.
- 2) Start engine and wait at least 3 seconds.
- Turn ignition switch "OFF", wait at least 7 seconds and then turn "ON".
- 4) Perform diagnostic test mode II (Self-diagnostic results) with ECM.

Check for linear voltage rise in response to increases to

about 4,000 rpm in engine speed.

Mass air flow sensor

- 1. Turn ignition switch "ON".
- 2. Start engine and warm it up sufficiently.
- 3. Check voltage between terminal 1 and ground.

Conditions	Voltage V
Ignition switch "ON" (Engine stopped.)	Less than 1.0
Idle (Engine is warmed-up sufficiently.)	1.3 - 1.7
Idle to about 4,000 rpm*	1.3 - 1.7 to Approx. 4.0

- *: Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed.
- If NĞ, remove mass air flow sensor from air duct. Check hot wire for damage or dust.

Absolute Pressure Sensor (DTC: 0803)

The absolute pressure sensor is connected to the MAP/BARO switch solenoid valve by a hose. The sensor detects ambient barometric pressure and intake manifold pressure and sends the voltage signal to the ECM. As the pressure increases, the voltage rises. The absolute pressure sensor is not used to control the engine system. It is used only for on-board diagnosis.

If the trouble is duplicated after "Procedure for malfunction A or B", perform "Procedure A" below. If the trouble is duplicated after "Procedure for malfunction C", perform "Procedure B" on next page.

Procedure A

Replace absolute pressure

sensor.

Disconnect and reconnect harness connectors in the circuit. Then retest.

Refer to "COMPONENT INSPECTION",

CHECK COMPONENT

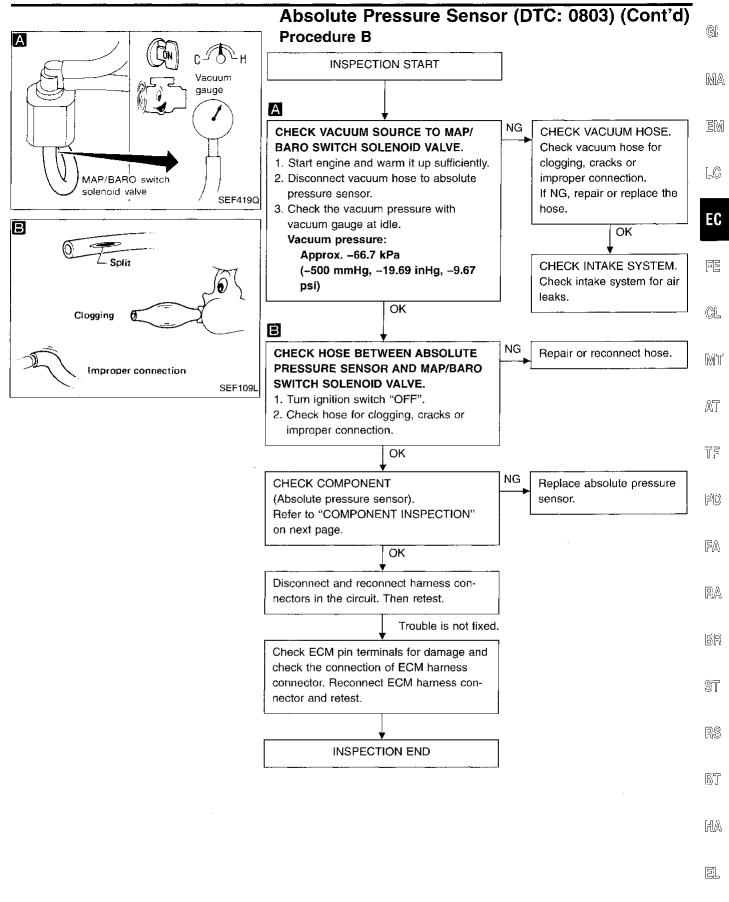

EC-104.

(Absolute pressure sensor).

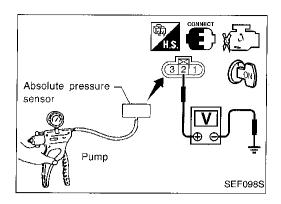

Trouble is not fixed.

Check ECM pin terminals for damage and check the connection of ECM harness connector. Reconnect ECM harness connector and retest.

INSPECTION END

IDX

Absolute Pressure Sensor (DTC: 0803) (Cont'd) COMPONENT INSPECTION

Absolute pressure sensor

- Remove absolute pressure sensor with its harness connector connected.
- 2. Remove hose from absolute pressure sensor.
- 3. Turn ignition switch "ON" and check output voltage between terminal ② and engine ground.

The voltage should be 3.2 to 4.8 V.

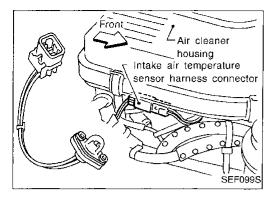

4. Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

CAUTION:

Always calibrate the vacuum pump gauge when using it.

5. If NG, replace absolute pressure sensor.

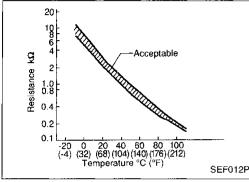

Intake Air Temperature Sensor (DTC: 0401)

The intake air temperature sensor is mounted to the air duct. The sensor detects intake air temperature and transmits a signal to the ECM.

The temperature sensing unit uses a thermistor, which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the temperature rise.

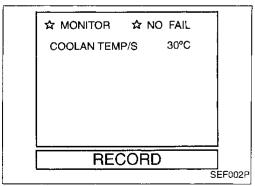

This sensor is not used to control the engine system. It is used only for the on-board diagnosis.

(Reference data)

Intake air temperature °C (°F)	Resistance (k Ω)

Throttle Position Sensor (DTC: 0403)

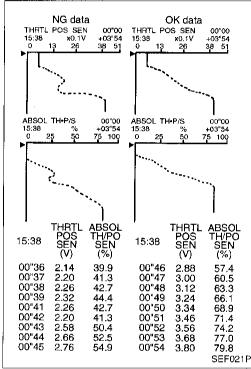

The throttle position sensor responds to the accelerator pedal movement. This sensor is a kind of potentiometer which transforms the throttle position into output voltage, and emits the voltage signal to the ECM. In addition, the sensor detects the opening and closing speed of the throttle valve and feeds the voltage signal to the ECM.

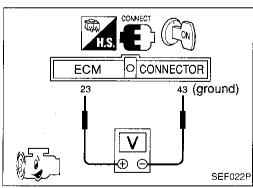

Idle position of the throttle valve is determined by the ECM receiving the signal from the throttle position sensor. This controls engine operation such as fuel cut. The throttle position sensor unit contains a built-in "Wide open and closed throttle position switch".

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0120 0403	 An excessively low or high voltage from the sensor is sent to ECM. Voltage sent to ECM is not practical when compared with mass air flow sensor and camshaft position sensor signals. 	Harness or connectors (The sensor circuit is open or shorted.) Throttle position sensor

Throttle Position Sensor (DTC: 0403) (Cont'd) OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the throttle position sensor. During this check, a DTC might not be confirmed.

- Start engine and warm it up sufficiently.
 - Turn ignition switch "OFF" and wait at least 7 seconds.
 - Turn ignition switch "ON" 3)
 - Select "MANU TRIG" and "HI SPEED" in "DATA MONI-TOR" mode with CONSULT.
 - Select "THRTL POS SEN" and "ABSOL TH-P/S" in "DATA MONITOR" mode with CONSULT.
 - Press RECORD on CONSULT SCREEN at the same time accelerator pedal is depressed.
 - 7) Print out the recorded data and check the following:
 - The voltage when accelerator pedal fully released is 0.3 - 0.7V.
 - The voltage rise is linear in response to accelerator pedal depression.
 - The voltage when accelerator pedal fully depressed is approximately 4V.

- 2) Turn ignition switch "OFF" and wait at least 7 seconds.
- 3) Turn ignition switch "ON".
- Check the voltage between ECM terminal (23) and (43) (ground) and check the following:
 - The voltage when accelerator pedal fully released is 0.3 - 0.7V.
 - The voltage rise is linear in response to accelerator pedal depression.
 - The voltage when accelerator pedal fully depressed is approximately 4V.

Ontont voltage
Front Heated Oxygen Sensor (Front HO2S) (DTC: 0303)

The front HO2S is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0130 0303	 An excessively high voltage from the sensor is sent to ECM. The voltage from the sensor is constantly approx. 0.3V. The maximum and minimum voltages from the sensor do not reach the specified voltages. The sensor does not respond between rich and lean within the specified time. 	 Harness or connectors (The sensor circuit is open or shorted.) Front heated oxygen sensor Fuel pressure Injectors Intake air leaks

Front Heated Oxygen Sensor (Front HO2S) (DTC: 0303) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a DTC might not be confirmed.

Start engine and warm it up sufficiently.

 Select "MANU TRIG" and "HI SPEED" in "DATA MONI-TOR" mode with CONSULT, and select "FR O2 SEN-SOR" and "FR O2 MNTR".

3) Hold engine speed at 2,000 rpm under no load during the following steps.

4) Touch "REČORĎ" on CONSULT screen.

Check the following.

 "FR O2 MNTR" in "DATA MONITOR" mode changes from "RICH" to "LEAN" to "RICH" 5 times in 10 seconds.

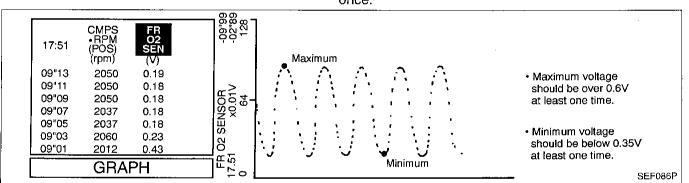

5 times (cycles) are counted as shown below:

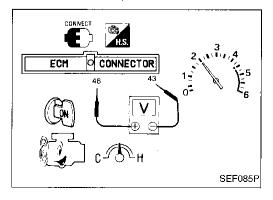

cycle | 1 | 2 | 3 | 4 | 5 | FR O2 MNTR R-L-R-L-R-L-R-

R = "FR O2 MNTR", "RICH" L = "FR O2 MNTR", "LEAN"

 "FR O2 SENSOR" voltage goes above 0.6V at least once.

 "FR O2 SENSOR" voltage goes below 0.35V at least once.

1) Start engine and warm it up sufficiently.

· OR ·

 Set voltmeter probes between ECM terminal (6) (sensor signal) and (3) (engine ground).

Check the following with engine speed held at 2,000 rpm constant under no load.

 Malfunction indicator lamp goes on more than 5 times within 10 seconds in Diagnostic Test Mode II (FRONT HEATED OXYGEN SENSOR MONITOR).

The maximum voltage is over 0.6V at least one time.

The minimum voltage is below 0.35V at least one time.

Front Heated Oxygen Sensor Heater (DTC: 0901)

SYSTEM DESCRIPTION

The ECM performs ON/OFF control of the front heated oxygen sensor heater corresponding to the engine conditions.

Engine speed (rpm)	Engine condition	Front heated oxygen sensor heater
Above 3,000	_	OFF
D-1 0 000	Heavy load	OFF
Below 3,000	Except above	ON

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0135 0901	 The current amperage in the front heated oxygen sensor heater circuit is out of the normal range. (An improper voltage drop signal is sent to ECM through the front heated oxygen sensor heater.) 	Harness or connectors (The front heated oxygen sensor heater circuit is open or shorted.) Front heated oxygen sensor heater

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- Start engine and run it for at least 5 seconds at idle speed.

- 1) Start engine and run it for at least 5 seconds at idle speed.
- 2) Select "MODE 3" with GST.

1) Start engine and run it for at least 5 seconds at idle speed.

- OR -

- 2) Turn ignition switch "OFF", wait at least 7 seconds and then turn "ON".
- 3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.

COMPONENT INSPECTION

Front heated oxygen sensor heater

Check resistance between terminals 3 and 1.

Resistance: 3.0 - 4.0 Ω at 25°C (77°F)

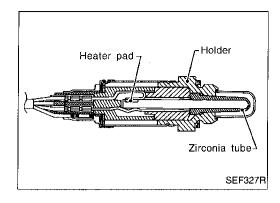

Check continuity between terminals 2 and 1, 3 and 2.

Continuity should not exist.

If NG, replace the front heated oxygen sensor.

CAUTION:

• Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.

Rear Heated Oxygen Sensor (Rear HO2S) (DTC: 0707)

The rear heated oxygen sensor (Rear HO2S), after three way catalyst, monitors the oxygen level in the exhaust gas.

Even if switching characteristics of the front heated oxygen sensor are shifted, the air fuel ratio is controlled to stoichiometric, by the signal from the rear heated oxygen sensor.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the rear heated oxygen sensor is not used for engine control operation.

EC

Gl

MA

EM

LC.

ON-BOARD DIAGNOSIS LOGIC

The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of rear heated oxygen sensor, ECM monitors the sensor's voltage value and the switching response during the various driving condition such as fuel-cut.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0156 0708	 An excessively high voltage from the sensor is sent to ECM. The voltage from the sensor is constantly approx. 0.3V. The maximum and minimum voltages from the sensor are not reached to the specified voltages. It takes more time for the sensor to respond between rich and lean than the specified time. 	Fuel pressure

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the rear heated oxygen sensor circuit. During this check, a DTC might not be confirmed.

- 1) Start engine and warm it up sufficiently.
- Select "FUEL INJECTION" in "ACTIVE TEST" mode, and select "RR O2 SENSOR" as the monitor item with CONSULT.
- 3) Check "RR O2 SENSOR" at idle speed when adjusting "FUEL INJECTION" to ±25%.

"RR O2 SENSOR" should be above 0.48V at least once when the "FUEL INJECTION" is +25%. "RR O2 SENSOR" should be below 0.43V at least once when the "FUEL INJECTION" is -25%.

- 1) Start engine and warm it up sufficiently.
- 2) Set voltmeter probes between ECM terminals (2) (sensor signal) and (3) (engine ground).

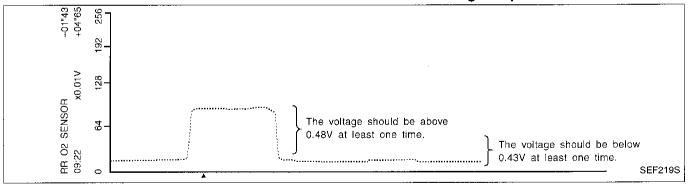

- OR -

 Check the voltage when racing up to 4,000 rpm under no load at least 10 times.
 (depress and release accelerator pedal as soon as pos-

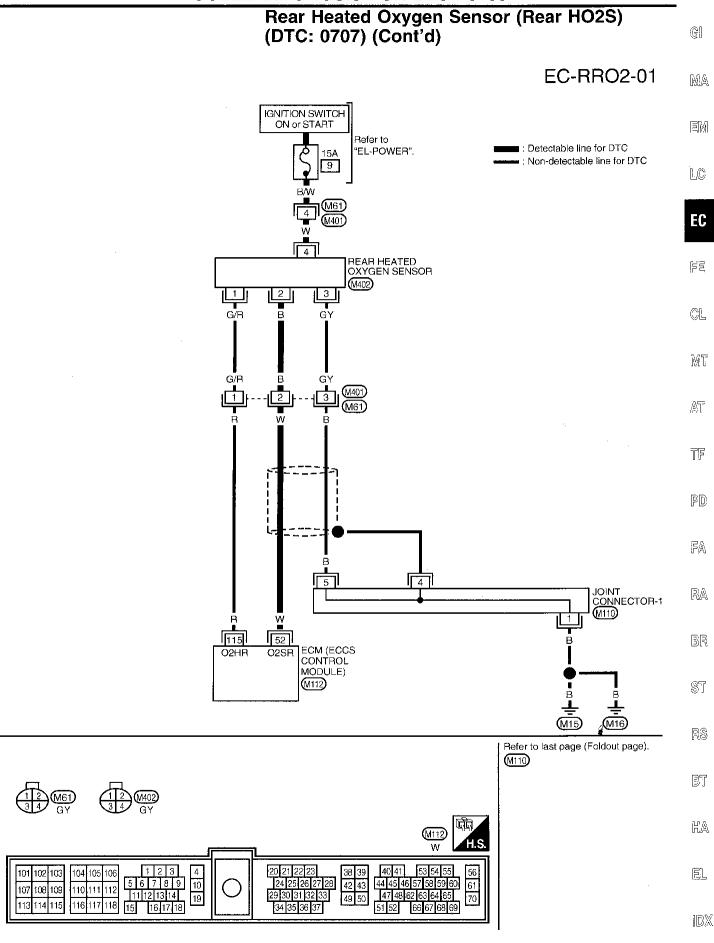

The voltage should be above 0.48V and below 0.43V at least once during this procedure. If the voltage can be confirmed in step 3, step 4 is not necessary.

4) Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position.

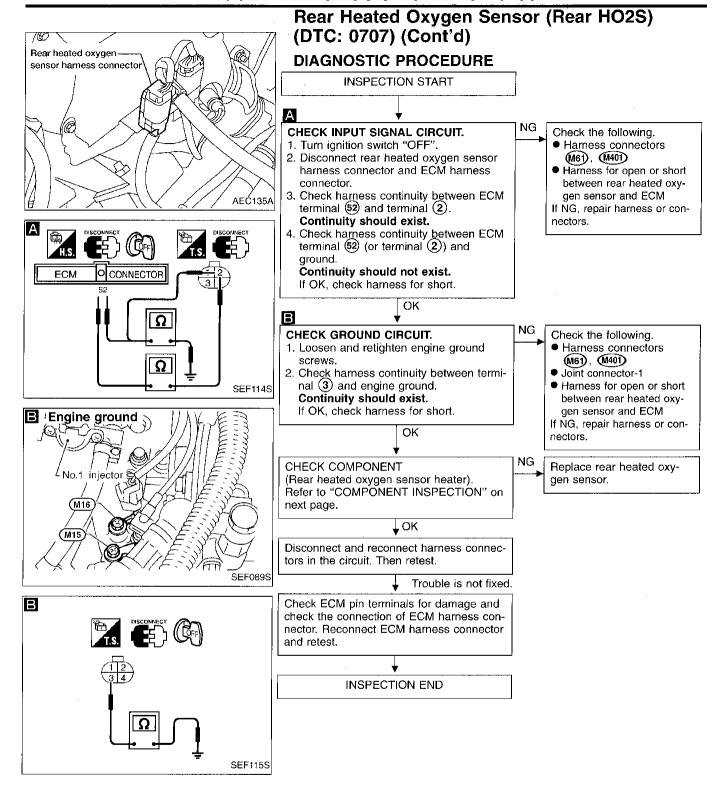

The voltage should be above 0.48V and below 0.43V at least once during this procedure.

MOX

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (DTC: 0701 - 0605)

ON BOARD DIAGNOSIS LOGIC

If a misfire occurs, the engine speed will fluctuate. If the fluctuation is detected by the crankshaft position sensor (OBD), the misfire is diagnosed.

The misfire detection logic consists of the following two conditions.

Crankshaft position sensor (OBD)	Engine speed	ECM
\	·	

1. One Trip Detection Logic (Three Way Catalyst Damage)

When a misfire is detected which will overheat and damage the three way catalyst, the malfunction indicator lamp (MIL) will start blinking; even during the first trip. In this condition, ECM monitors the misfire every 200 revolutions.

If the misfire frequency decreases to a level that will not damage the three way catalyst, the MIL will change from blinking to lighting up.

(After the first trip detection, the MIL will light up from engine starting. If a misfire is detected that will cause three way catalyst damage, the MIL will start blinking.)

2. Two Trip Detection Logic (Exhaust quality deterioration)

When a misfire that will not damage the three way catalyst (but will affect exhaust emission) occurs, the malfunction indicator lamp will light up based on the second consecutive trip detection logic. In this condition, ECM monitors the misfire for every 1,000 revolutions of the engine.

Diagnostic Trouble Code Nos.	Malfunction is detected when	Check Items (Possible Cause)
P0300 (0701)	Multiple cylinders misfire.	Improper spark plugInsufficient compression
P0301 (0608)	■ No. 1 cylinder misfires.	Incorrect fuel pressure EGR valve

Crankshaft Position Sensor (CKPS) (OBD) (DTC: 0802)

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not used to control the engine system. It is used only for the on board diagnosis of misfire.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0335 0802	 The proper pulse signal from the crankshaft position sensor (OBD) is not sent to ECM while the engine is running at the specified engine speed. 	 Harness or connectors (The crankshaft position sensor (OBD) circuit is open.) Crankshaft position sensor (OBD)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Camshaft Position Sensor (CMPS) (DTC: 0101)

The camshaft position sensor is a basic component of the ECCS. It monitors engine speed and piston position. These input signals to the ECM are used to control fuel injection, ignition timing and other functions.

The camshaft position sensor has a rotor plate and a wave-forming circuit. The rotor plate has 360 slits for a 1° signal and 4 slits for a 180° signal. The wave-forming circuit consists of Light Emitting Diodes (LED) and photo diodes.

The rotor plate is positioned between the LED and the photo diode. The LED transmits light to the photo diode. As the rotor plate turns, the slits cut the light to generate rough-shaped pulses. These pulses are converted into on-off signals by the wave-forming circuit and sent to the ECM.

Diagnostic Trouble Code No.	Malfunction is detected when	Check items (Possible cause)
P0340 0101	 Either 1° or 180° signal is not sent to ECM for the first few seconds during engine cranking. 	Harness or connectors (The camshaft position sensor circuit is open or shorted.)
	 Either 1° or 180° signal is not sent to ECM often enough while the engine speed is higher than the specified engine speed. 	 Camshaft position sensor Starter motor (Refer to EL section.) Starting system circuit (Refer to EL section.) Dead (Weak) battery
	 The relation between 1° and 180° signal is not in the normal range during the specified engine speed. 	

DIAGNOSTIC TROUBLE CODE CONFIRMATION **PROCEDURE**

Note: Before performing the following procedure, confirm that battery voltage is more than 10.5V.

- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- Start engine and run it for 2 seconds. (If engine does not run, crank engine for at least 2 seconds.)

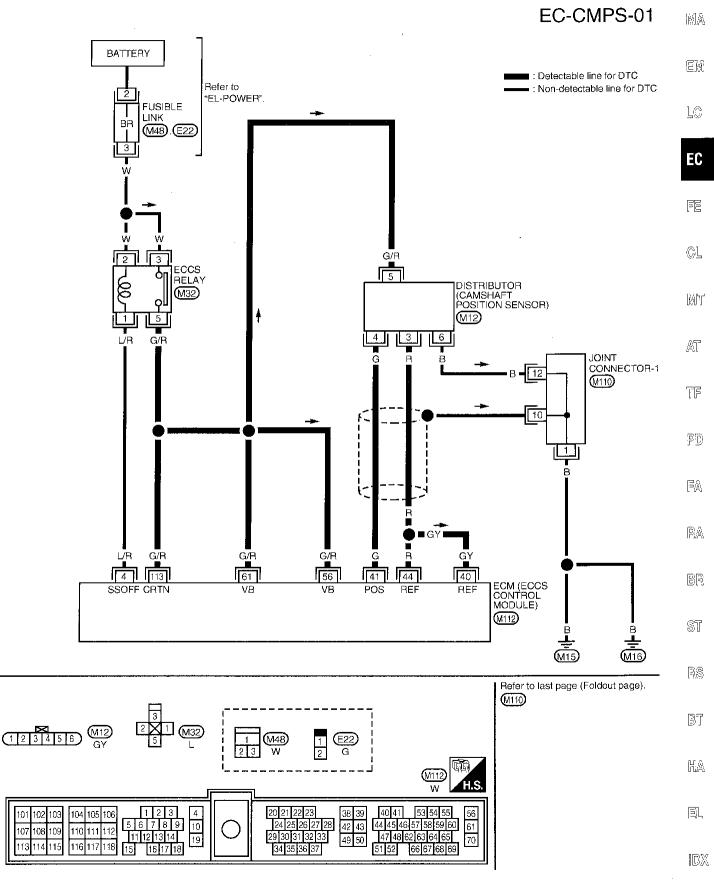

- OR 1) Start engine and run it for 2 seconds. (If engine does not run, crank engine for at least 2 seconds.)
- Select "MODE 3" with GST.

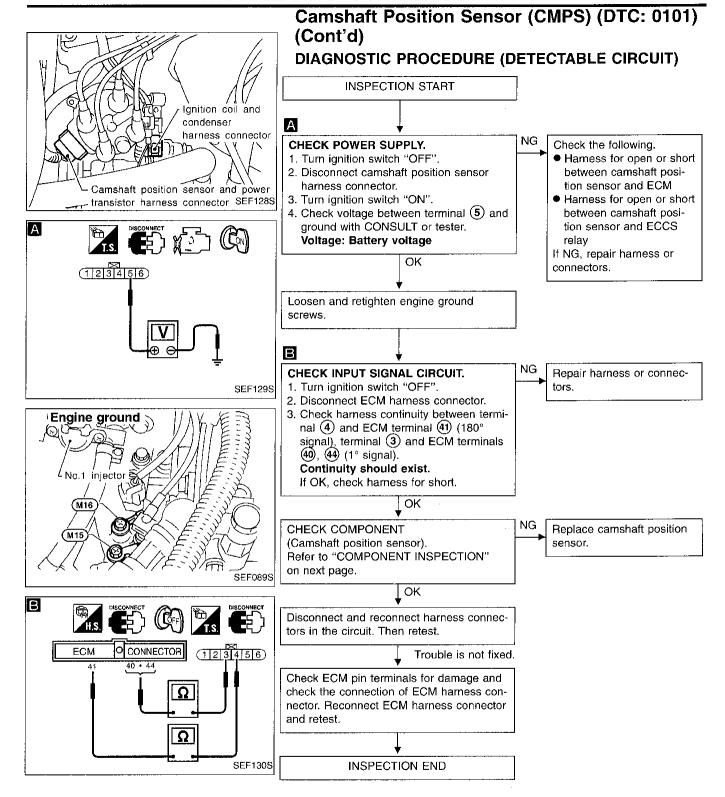

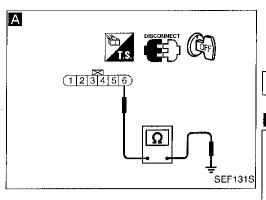

- OR -Start engine and run it for 2 seconds. (If engine does not run, crank engine for at least 2 seconds.
- Turn ignition switch "OFF", wait at least 7 seconds and then turn "ON".
- Perform Diagnostic Test Mode II (Self-diagnostic results) with ECM.

 $\mathbb{D}\mathbb{X}$

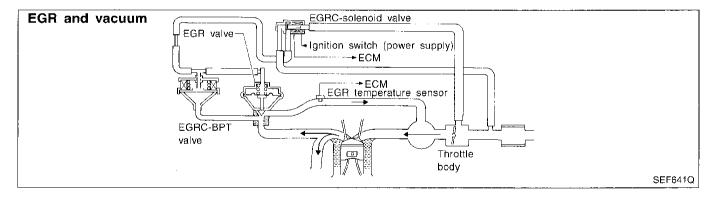

EGR Function (DTC: 0302)

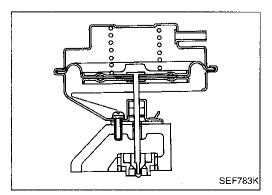

SYSTEM DESCRIPTION

This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current flows through the solenoid valve. This causes the port vacuum to be discharged into the atmosphere and the EGR valve remains closed.

- Low engine coolant temperature
- Engine starting
- Engine stopped
- Engine idling
- Excessively high engine coolant temperature
- Mass air flow sensor malfunction

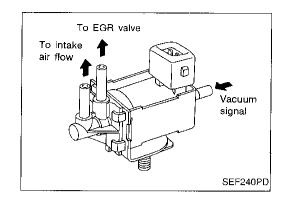

COMPONENT DESCRIPTION

Exhaust gas recirculation (EGR) valve

The EGR valve controls the amount of exhaust gas routed to the intake manifold. Vacuum is applied to the EGR valve in response to throttle valve opening. The vacuum controls the movement of a taper valve connected to the vacuum diaphragm in the EGR valve.

306

EGR Function (DTC: 0302) (Cont'd)

EGRC-solenoid valve

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. A plunger will then move to cut the vacuum signal (from the throttle body to the EGR valve).

When the ECM sends an OFF signal, the vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.

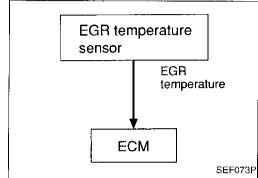

G]

EM.

LC

EC

ON BOARD DIAGNOSIS LOGIC

If the absence of EGR flow is detected by EGR temperature sensor under the condition that calls for EGR, a low-flow malfunction is diagnosed.

If EGR temperature sensor detects EGR flow under the condition that does not call for EGR, a high-flow malfunction is diagnosed.

FE

MT

(GL

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)

Overall function check

EGR Function (DTC: 0302) (Cont'd)

Procedure for malfunction A

- 1) Start engine and warm it up sufficiently.
- 2) Check for the EGR valve lifting when revving from 2,000 rpm up to 4,000 rpm under no load.

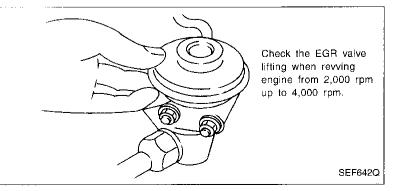

EGR valve should lift up and down without sticking. If EGR valve does not lift up and down, try again with either of the following methods:

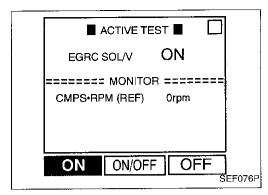

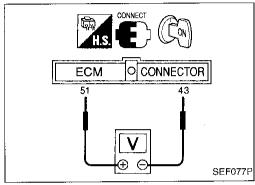

- Select "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode with CONSULT and turn the solenoid valve "OFF".
- Disconnect EGRC-solenoid valve harness connector. (The DTC for EGRC-solenoid valve will be displayed, however, ignore it.)
- Check voltage between EGR temperature sensor harness connector terminal ① and ground at idle speed.
 Less than 4.5V should exist.
- 4) Turn ignition switch "OFF".

 Check harness continuity between EGR temperature sensor harness connector terminal ② and ECM terminal ⑤.

 Continuity should exist.
- 5) Perform "COMPONENT INSPECTION", "EGR temperature sensor", EC-173.

EGR Function (DTC: 0302) (Cont'd)

Procedure for malfunction B

- Start engine. 1)
- Turn EGRC-solenoid valve "ON" in "ACTIVE TEST" 2) mode with CONSULT.
- Check for the EGR valve lifting when revving from 2,000 rpm up to 4,000 rpm under no load.

EGR valve should be closed and should not lift up. - OR

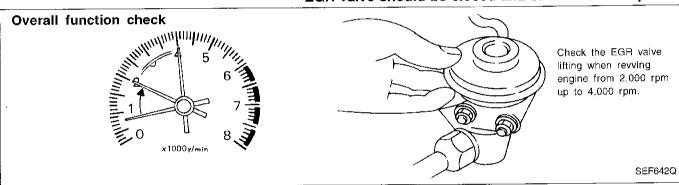

- Confirm the engine coolant temperature is lower than 1) 55°C (131°F) in "Mode 1" with generic scan tool. Perform the following steps before its temperature becomes higher than 55°C (131°F).
- Start engine. 2)
- Check for the EGR valve lifting when revving from 2,000 3) rpm up to 4,000 rpm under no load.

EGR valve should be closed and should not lift up. - OR -

NO TOOLS

- Confirm the voltage between ECM terminals (5) and (4) 1) is higher than 2.08V. Perform the following steps before the voltage becomes lower than 2.08V.
- 2) Start engine.
- Check for the EGR valve lifting when revving from 2,000 3) rpm up to 4,000 rpm under no load.

EGR valve should be closed and should not lift up.

EGRC-solenoid valve

Check solenoid valve, following the table as shown below:

Conditions	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals 1 and 2	Yes	No
No supply	No	Yes

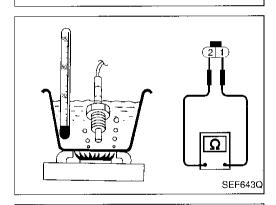

If NG, replace the solenoid valve.

Check resistance change and resistance value.

EGR temperature °C (°F)	Voltage (V)	Resistance $(M\Omega)$
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

If NG, replace EGR temperature sensor.

EGRC-BPT valve

Plug one of two ports of EGRC-BPT valve.

3. If a leakage is noted, replace the valve.

RA

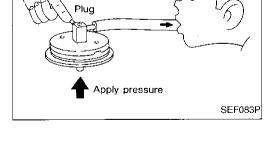

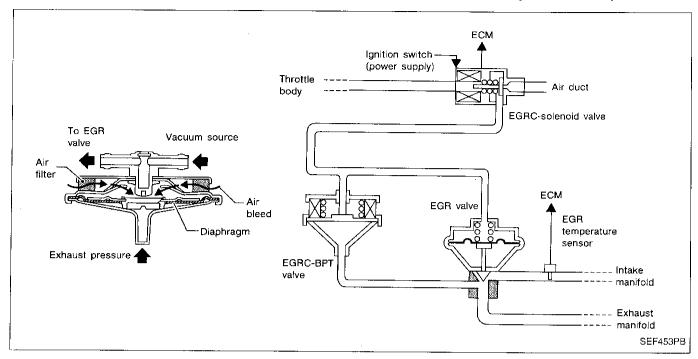

EGRC-BPT Valve Function (DTC: 0306)

SYSTEM DESCRIPTION

The EGRC-BPT valve monitors exhaust pressure to activate the diaphragm, controlling throttle body vacuum applied to the EGR valve. In other words, recirculated exhaust gas is controlled in response to positioning of the EGR valve or to engine operation.

ON BOARD DIAGNOSIS LOGIC

If too much EGR flow exists due to an EGRC-BPT valve malfunction, off idle engine roughness will increase. If the roughness is large, then the vacuum to the EGR valve is interrupted through the EGRC-solenoid valve. If the engine roughness is reduced at that time, the EGRC-BPT valve malfunction is indicated.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0402	■ The EGRC-BPT valve does not operate properly.	● EGRC-BPT valve
0306		Misconnected rubber tube
		● Blocked rubber tube

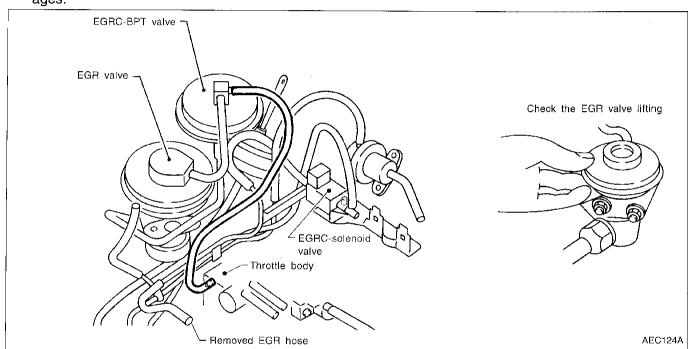

EGRC-BPT Valve Function (DTC: 0306) (Cont'd)

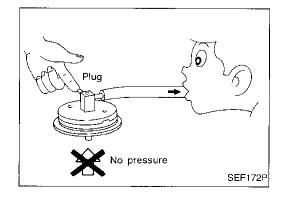

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EGRC-BPT valve. During this check, a DTC might not be confirmed.

- Disconnect the rubber tube to the EGRC-solenoid valve at the intake manifold.
- 2. Disconnect the rubber tube to the EGRC-solenoid valve at the EGRC-BPT valve. Connect the intake manifold and the EGRC-BPT valve. (The intake manifold vacuum will be directly applied to the EGRC-BPT valve.)
- 3. Start engine.
- 4. Check for the EGR valve lifting with engine at less than 1,500 rpm under no load. **EGR valve should remain closed.**
- 5. Check the EGR valve lifting when revving from 2,000 rpm up to 4,000 rpm under no load.

 EGR valve should lift up, and go down without sticking when the engine is returned to idle.
- 6. Check rubber tube between EGRC-solenoid valve and throttle body for misconnection, cracks or blockages.

COMPONENT INSPECTION

EGRC-BPT valve

- Plug one of two ports of EGRC-BPT valve.
- Vacuum from the other port and check leakage without applying any pressure from under EGR-BPT valve.
 Leakage should exist.

Three Way Catalyst Function (DTC: 0702)

ON BOARD DIAGNOSIS LOGIC

The ECM monitors the switching frequency ratio of front heated oxygen sensor and rear heated oxygen sensor.

A three way catalyst with high oxygen storage capacity will indicate a low switching frequency of rear heated oxygen sensor. As oxygen storage capacity decreases, the rear heated oxygen sensor switching frequency will increase.

When the frequency ratio of front heated oxygen sensor and rear heated oxygen sensor approaches a specified limit value, the second stage diagnosis is applied.

The second stage diagnosis switches the mixture ratio feedback control using front heated oxygen sensor to rear heated oxygen sensor.

Then ECM measures the switching lag time between front heated oxygen sensor and rear heated oxygen sensor.

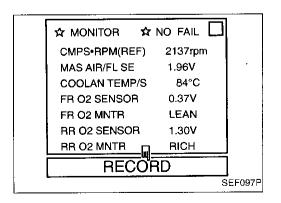

The longer lag time indicates the greater oxygen storage capacity. If the lag time is within the specified level, the three way catalyst malfunction is diagnosed.

• The three way catalyst function has one trip detection logic.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0420 0702	 Three way catalyst does not operate properly. Three way catalyst does not have enough oxygen storage capacity. 	 Three way catalyst Exhaust tube Intake air leak Injectors Injector leak

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the three way catalyst. During this check, a DTC might not be confirmed.

- 1) Start engine and warm it up sufficiently.
- 2) Set "MANU TRIG" and "HI SPEED", then select "FR O2 SENSOR", "RR O2 SENSOR", "FR O2 MNTR", "RR O2 MNTR" in "DATA MONITOR" mode with CONSULT.
- 3) Touch "RECORD" on CONSULT screen with engine speed held at 2,000 rpm constant under no load.
- 4) Make sure that the switching frequency between "RICH" and "LEAN" of "RR O2 SENSOR" is very less than that of "FR O2 SENSOR".

Switching frequency ratio =

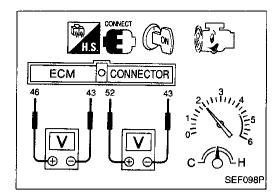

Rear heated oxygen sensor switching frequency

Front heated oxygen sensor switching frequency

This ratio should be less than 0.6 (2WD models) and 0.8 (4WD models).

If the ratio is greater than 0.6 (2WD models) and 0.8 (4WD models), the three way catalyst is not operating properly.

_	
11	٠.
\sim	

Three Way Catalyst Function (DTC: 0702) (Cont'd)

1) Start engine and warm it up sufficiently.

Set voltmeter probes between ECM terminals (46) (front heated oxygen sensor signal) and (a) (engine ground), and ECM terminals (2) (rear heated oxygen sensor signal) and (43) (engine ground).

Keep engine speed at 2,000 rpm constant under no load.

4) Make sure that the voltage switching frequency (high & low) between ECM terminals 52 and 43 is very less than that of ECM terminals 46 and 43. Switching frequency ratio =

Rear heated oxygen sensor voltage switching fre-

Front heated oxygen sensor voltage switching frequency

This ratio should be less than 0.6 (2WD models) and 0.8 (4WD models).

If the ratio is greater than 0.6 (2WD models) and 0.8 (4WD models), it means three way catalyst does not operate properly.

Note: If the voltage at terminal 46 does not switch periodically more than 5 times within 10 seconds at step 3, perform TROUBLE DIAGNOSIS FOR DTC P0130 (Front heated oxygen sensor) first. (See page EC-124.)

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705)

ON BOARD DIAGNOSIS LOGIC

This diagnosis uses two methods to detect leaks in the EVAP purge line.

The first method, the pressure test, makes use of vapor pressure in the fuel tank. The second method, the vacuum test, makes use of engine intake manifold vacuum.

Pressure test

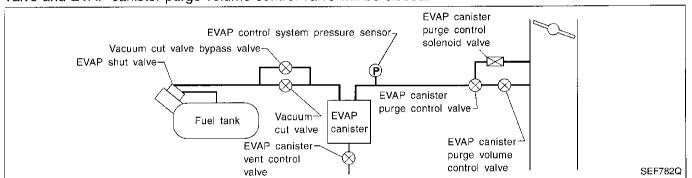

The EVAP canister vent control valve is closed to shut the EVAP purge line. The vacuum cut valve bypass valve will then be opened to clear the line between the fuel tank and the EVAP canister purge control valve. The EVAP control system pressure sensor can now monitor the pressure inside the fuel tank.

If pressure increases, the ECM will check for leaks in the line between the vacuum cut valve and EVAP canister purge control valve. If no pressure does not increase, the ECM will perform the "Vacuum test".

Vacuum test

If pressure does not increase in the "Pressure test", the ECM will check for leaks in the line between the fuel tank and EVAP canister purge control valve, under the following "Vacuum test" conditions.

The vacuum cut valve bypass valve is opened to clear the line between the fuel tank and the EVAP canister purge control valve. The EVAP canister vent control valve will then be closed to shut the EVAP purge line off. The EVAP canister purge volume control valve and EVAP canister purge control valve are opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge control valve and EVAP canister purge volume control valve will be closed.

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0440 0705	EVAP control system has a leak. EVAP control system does not operate properly.	 Incorrect fuel tank vacuum relief valve Incorrect fuel filler cap used Fuel filler cap remains open or fails to close. Foreign matter caught in fuel filler cap. Leak is in line between intake manifold and EVAP canister purge control valve. Foreign matter caught in EVAP canister vent control valve. EVAP canister or fuel tank leaks EVAP purge line (pipe and rubber tube) leaks EVAP purge line rubber tube bent. Blocked or bent rubber tube to EVAP control system pressure sensor Loose or disconnected rubber tube EVAP canister purge control valve EVAP canister purge volume control valve EVAP canister purge control solenoid valve Absolute pressure sensor Tank fuel temperature sensor MAP/BARO switch solenoid valve Blocked or bent rubber tube to MAP/BARO switch solenoid valve

CAUTION:

- Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL
 may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine rubber tube as a replacement.

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

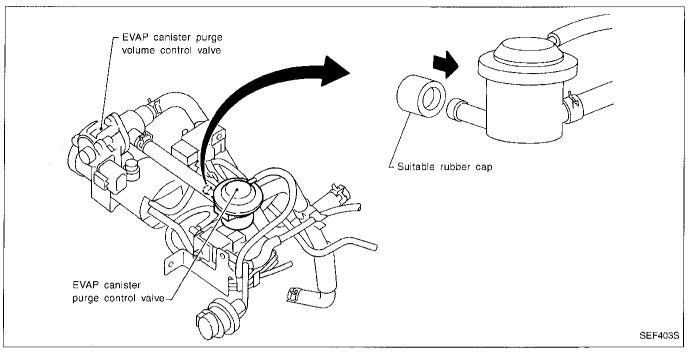

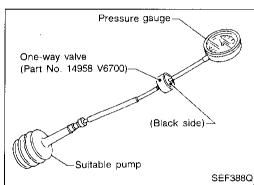

CAUTION:

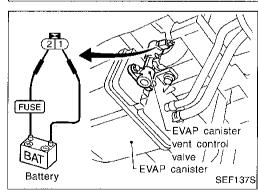

Always select "SINGLE TEST" with CONSULT when performing the "FUNCTION TEST".

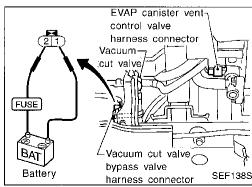

- 1) Select "EVAP (SMALL LEAK)" in "FUNCTION TEST" mode with CONSULT.
- 2) Make sure that "OK" is displayed with "EVAP (SMALL LEAK)". (If "NG" is displayed, refer to "DIAGNOSTIC PROCEDURE".)
- Check fuel filler cap and fuel tank when the fuel tank is more than 3/4 full.
 Refer to "DIAGNOSTIC PROCEDURE", EC-183.

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EVAP control system (Small leak). During this check, a DTC might not be confirmed.

NOTE:

Prepare one-way valve (Part No. 14958 V6700) for this test.

- 1) Turn ignition switch "OFF".
- Completely fill fuel tank.
- 3) As shown in the illustration above, disconnect hose running between EVAP canister purge volume control valve and EVAP canister purge control valve. Plug EVAP canister purge control valve connector using suitable rubber blind cap.

NOTE:

- Do not use incorrect size blind cap or damage to connector may result.
- Be sure to prevent blind cap from separating from connector when a pressure of +13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi) is applied.
 - 4) Set up one-way valve (Part No. 14958 V6700), pressure gauge and suitable pump as shown at left. Pressurize the system to 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). Measure the amount of depressurization in kPa (mmHg, inHg) after one minute with the system left unattended.
 - 5) Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12V until the end of test.)
 - 6) Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12V until the end of test.)

B

CHECK EVAP PURGE LINE.

Check EVAP purge line (pipe, rubber tube, fuel tank and EVAP canister) for cracks. Refer to "EVAPORATIVE EMISSION SYSTEM, EC-19.

To locate cracked areas, apply soapy water to locations in question. Disconnect EVAP hose running between EVAP canister purge volume control valve and EVAP canister purge control valve. Plug EVAP canister purge control valve connector using a rubber blind cap. Refer to EC-181. Apply pump pressure as shown in the figure at left. Air bubbles will appear from cracked areas.

CAUTION:

Do not allow pump pressure to exceed 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). A higher pressure may damage fuel tank and EVAP canister.

- Do not use super color check liquid, etc.
- Do not depressurize inside EVAP purge line.
- 1. Turn ignition switch "OFF".
- Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12V until the end of test.)
- Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12V until the end of test.)
- Disconnect rubber tube between vacuum cut valve and EVAP shut valve. Set up one-way valve (Part No. 14958 V6700), pressure gauge and suitable pump as shown at left.

OK

_____▼ Clean EVAP purge line (pipe and rubber

tube) using air blower.

Disconnect and reconnect harness connectors in the circuit. Then retest.

Trouble is not fixed.

Check ECM pin terminals for damage and check the connection of ECM harness connector. Reconnect ECM harness connector and retest.

INSPECTION END

Repair or replace it.

COMPONENT INSPECTION

EVAP canister purge volume control valve

- Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal ② and terminals ①, ③ terminal ⑤ and terminals ④, ⑥

Resistance:

Approximately 30 Ω [At 25°C (77°F)]

- 3. Reconnect EVAP canister purge volume control valve harness connector.
- Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5. Turn ignition switch "ON".
- 6. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the valve opening. If NG, replace the EVAP canister purge volume control valve.

- 1. Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal ② and terminals ①, ③ terminal ⑤ and terminals ④, ⑥

- OR -

Resistance:

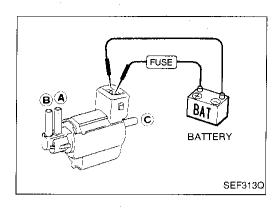

Approximately 30Ω [At 25°C (77°F)]

- Reconnect EVAP canister purge volume control valve harness connector.
- 4. Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.

(Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)

5. Turn ignition switch "ON" and "OFF". Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the ignition switch position.

If NG, replace the EVAP canister purge volume control valve.

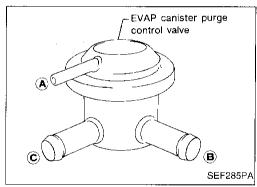

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

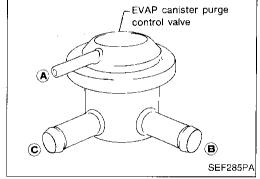

EVAP canister purge control solenoid valve

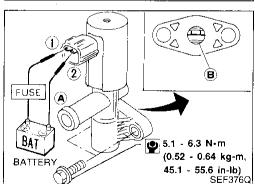

Check air passage continuity.

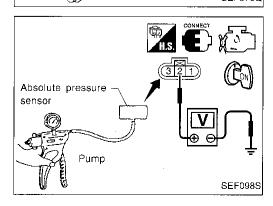

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals	Yes	No
No supply	No	Yes

If NG, replace solenoid valve.

EVAP canister purge control valve

Check EVAP canister purge control valve as follows:

Plug the port (B).

Apply pressure [80.0 kPa (600 mmHg, 23.62 inHg, 11.60 psi)] to port (A). Then keep it for 15 seconds, and check there is no leakage.

Repeat step 2 for port ©.

EVAP canister vent control valve

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals 1 and 2	No
No supply	Yes

If NG, clean valve using air blower or replace as necessary.

Absolute pressure sensor

- Remove absolute pressure sensor from bracket with its harness connector connected.
- Remove hose from absolute pressure sensor.
- Turn ignition switch "ON" and check output voltage between terminal 2 and engine ground.

The voltage should be 3.2 to 4.8 V.

Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

MAP/BARO switch solenoid valve

- 1. Start engine and warm it up sufficiently.
- 2. Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
- 3. Check the following.
 - When "MAP" is selected, "ABSOL PRES/SE" indicates approximately 1.3V.
 - When "BARO" is selected, "ABSOL PRES/SE" indicates approximately 4.3V.
- 4. If NG, replace solenoid valve.

- 1. Remove MAP/BARO switch solenoid valve.
- 2. Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals 1 and 2	Yes	No
No supply	No	Yes

3. If NG, replace solenoid valve.

Tank fuel temperature sensor

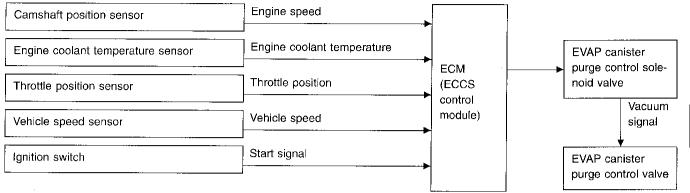

Check resistance by heating with hot water or heat gun as shown in the figure.

Temperature °C (°F)	Resistance k Ω
20 (68)	2.3 - 2.7
50 (122)	0.79 - 0.90

If NG, replace tank fuel temperature sensor.

Evaporative Emission (EVAP) Canister Purge Control Valve/Solenoid Valve (DTC: 0807)

SYSTEM DESCRIPTION

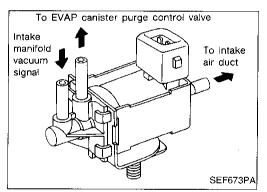

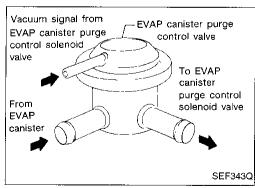

This system controls the vacuum signal applied to the EVAP canister purge control valve.

When the ECM detects any of the following conditions, current does not flow through the EVAP canister purge control solenoid valve.

The solenoid valve cuts the vacuum signal so that the EVAP canister purge control valve remains closed.

- Ignition switch "ON"
- Closed throttle position
- Low or high engine coolant temperature
- During deceleration
- Engine stopped
- Low vehicle speed (M/T models)

COMPONENT DESCRIPTION

EVAP canister purge control solenoid valve

The EVAP canister purge control solenoid valve responds to signals from the ECM. When the ECM sends an OFF signal, the vacuum signal (from the intake manifold to the EVAP canister purge control valve) is cut.

When the ECM sends an ON (ground) signal, the vacuum signal passes through the EVAP canister purge control solenoid valve. The signal then opens the EVAP canister purge control valve.

EVAP canister purge control valve

When the vacuum signal is cut by EVAP canister purge control solenoid valve, EVAP canister purge control valve closes.

Evaporative Emission (EVAP) Canister Purge Control Valve/Solenoid Valve (DTC: 0807) (Cont'd)

COMPONENT INSPECTION

EVAP canister purge control solenoid valve

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals	Yes	No
No supply	No	Yes

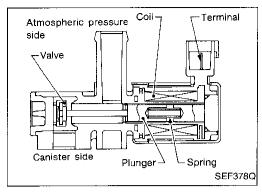

If NG, replace solenoid valve.

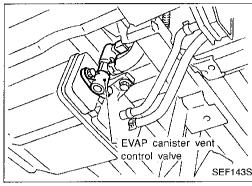

EVAP canister purge control valve

Check EVAP canister purge control valve as follows.

- Plug the port B.
- 2. Apply pressure [80.0 kPa (600 mmHg, 23.62 inHg, 11.60 psi)] to port (a). Then keep it for 15 seconds, and check there is no leakage.
- 3. Repeat step 2 for port ©.

Evaporative Emission (EVAP) Canister Vent Control Valve (DTC: 0903)

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid (the EVAP canister vent control valve) responds to signals from the ECM.

When the ECM sends an ON signal, the coil in the solenoid valve is energized.

A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative loss system components.

This solenoid valve is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative loss system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

Evaporative Emission (EVAP) Canister Vent Control Valve (DTC: 0903) (Cont'd) OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EVAP canister vent control valve circuit. During this check, a DTC might not be confirmed.

Procedure for malfunction B

- 1) Remove EVAP canister vent control valve from EVAP canister and disconnect hoses from the valve.
- 2) Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals 1 and 2	No
No supply	Yes

Idle Air Control Valve (IACV) — Auxiliary Air Control (AAC) Valve (DTC: 0205)

SYSTEM DESCRIPTION

This system automatically controls engine idle speed to a specified level. Idle speed is controlled through fine adjustment of the amount of air which by-passes the throttle valve via IACV-AAC valve. The IACV-AAC valve repeats ON/OFF operation according to the signal sent from the ECM. The camshaft position sensor detects the actual engine speed and sends a signal to the ECM. The ECM then controls the ON/OFF time of the IACV-AAC valve so that engine speed coincides with the target value memorized in ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warm up, deceleration, and engine load (air conditioner and power steering operation).

COMPONENT DESCRIPTION

IACV-ACC valve

The IACV-AAC valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of air that will flow through the valve. The more air that flows through the valve, the higher the idle speed.

Manifold Absolute Pressure (MAP)/Barometric Pressure (BARO) Switch Solenoid Valve (DTC: 1302)

SYSTEM DESCRIPTION

This system allows the absolute pressure sensor to monitor either ambient barometric pressure or intake manifold pressure. The MAP/BARO switch solenoid valve switches between two passages by ON-OFF pulse signals from the ECM. (One passage is from the intake air duct, the other is from the intake manifold.) Either ambient barometric pressure or intake manifold pressure is applied to the absolute pressure sensor.

Solenoid	Conditions
	Immediately after starting engine or
	 More than 5 minutes after the solenoid valve shuts OFF.
ON	and Throttle valve is shut or almost fully shut for more than 1 second and Vehicle speed is less than 100 km/h (62
	MPH).

COMPONENT DESCRIPTION

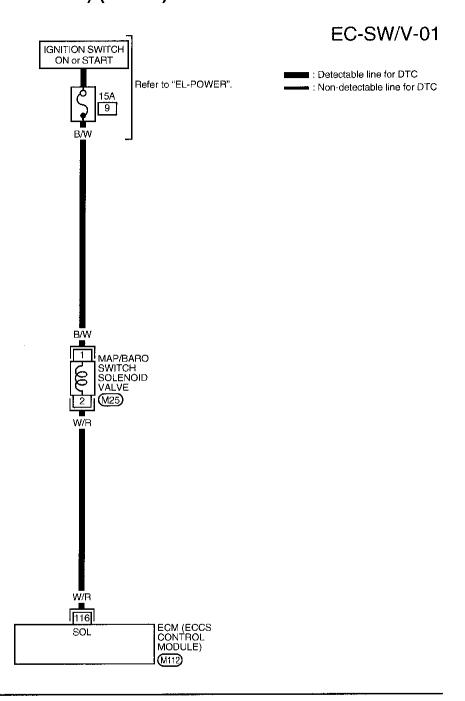

The MAP/BARO switch solenoid valve switches its air flow passage according to the voltage signal sent from the ECM. When voltage is supplied from the ECM, the MAP/BARO switch solenoid turns "ON". Then, the absolute pressure sensor can monitor the ambient barometric pressure. When voltage is not supplied from the ECM, the MAP/BARO switch solenoid valve turns "OFF". Then, the sensor monitors intake manifold pressure.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1105 1302	 MAP/BARO switch solenoid valve receives the voltage supplied though ECM does not supply the voltage to the valve. There is little difference between MAP/BARO switch solenoid valve input voltage at ambient barometric pressure and voltage at intake manifold pressure. 	 Harness or connectors (MAP/BARO switch solenoid valve circuit is open or shorted.) Hoses (Hoses are clogged or disconnected.) Absolute pressure sensor MAP/BARO switch solenoid valve

Swirl Control Valve Control Solenoid Valve (DTC: 1004)

SYSTEM DESCRIPTION

This system has a swirl control valve in the intake passage of each cylinder.

While idling and during low engine speed operation, the swirl control valve closes. Thus the velocity of the air in the intake passage increases, promoting the vaporization of the fuel and producing a swirl in the combustion chamber.

Because of this operation, this system tends to increase the burning speed of the gas mixture, improve fuel consumption, and increase the stability in running conditions.

Also, except when idling and during low engine speed operation, this system opens the swirl control valve. In this condition, this system tends to increase power by improving intake efficiency via reduction of intake flow resistance, intake flow.

The solenoid valve controls swirl control valve's shut/open condition. This solenoid valve is operated by the ECM.

	Throttle posi- tion switch (Idle position)	Engine speed	Swirl control valve control solenoid valve	Swirl control valve
	ON	Below 4,000 rpm	ON	Closed
_	OFF	Less than 2,800 rpm	ON	Closed
	OFF	More than 3,600 rpm	OFF	Open

When engine coolant temperature is below 0°C (32°F) swirl control valve is kept open.

Swirl control valve control solenoid valve

The swirl control valve control solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the solenoid valve is bypassed to apply intake manifold vacuum to the swirl control valve actuator. This operation closes the swirl control valve. When the ECM sends an OFF signal, the vacuum signal is cut and the swirl control valve opens.

Swirl Control Valve Control Solenoid Valve (DTC: 1004) (Cont'd)

Swirl Control Valve Control Vacuum Check Switch (DTC: 0112)

The swirl control valve control vacuum check switch detects vacuum signal to the swirl control valve, and sends "ON" or "OFF" signal to the ECM.

When no vacuum is supplied to the valve, the swirl control valve control vacuum check switch sends "OFF" signal to the ECM. The swirl control valve control vacuum check switch is not used to control the engine system, it is used for on board diagnosis.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible cause)
P1165 0112	The swirl control valve control vacuum check switch remains "OFF" under specified engine conditions.	 Harness or connectors (Swirl control valve control vacuum check switch circuit is open.) Hoses (Hoses are connected incorrectly.) Swirl control valve control solenoid valve Swirl control valve control vacuum check switch

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 7 seconds.
- 3) Turn ignition switch "ON".
- 4) Select "DATA MONITOR" mode with CONSULT.
- 5) Start engine and run it for at least 5 seconds at 3,800 rpm under no load.

 OR

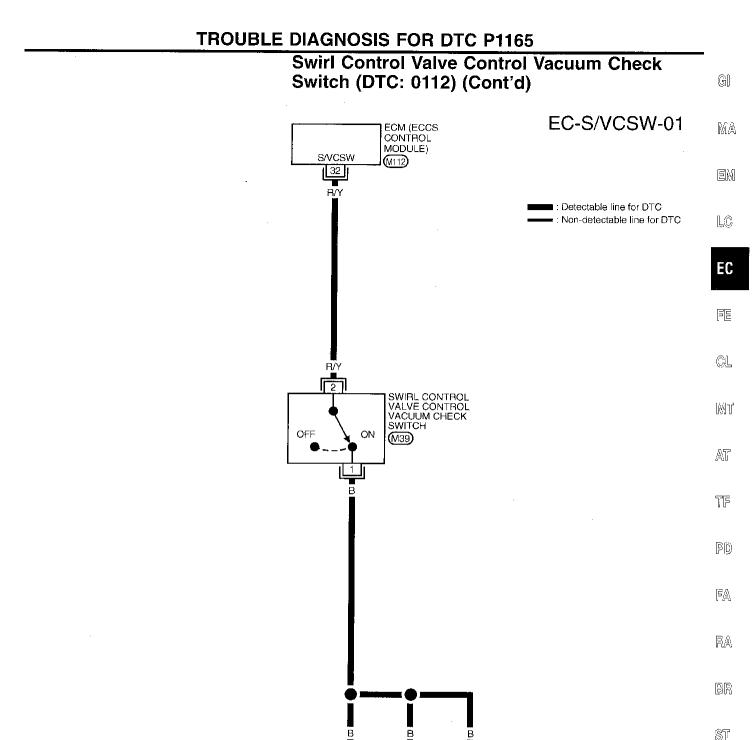

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 7 seconds.
- 3) Start engine and run it for at least 5 seconds at 3,800 rpm under no load.
- 4) Select "MODE 3" with GST.

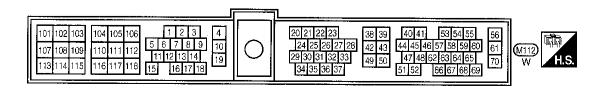

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 7 seconds.
- 3) Turn ignition switch "ON".
- 4) Start engine and run it for at least 5 seconds at 3,800 rpm under no load.
- 5) Turn ignition switch "OFF", wait at least 7 seconds and then turn "ON".
- 6) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Swirl Control Valve Control Vacuum Check Switch (DTC: 0112) (Cont'd)

Check ECM pin terminals for damage and check the connection of ECM harness connector. Reconnect ECM harness connector and retest.

INSPECTION END

Swirl control valve control vacuum check switch— Vacuum pump SEF378S

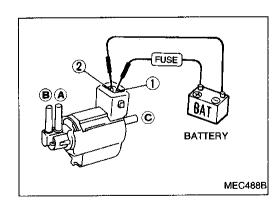

COMPONENT INSPECTION

Swirl control valve control vacuum check switch

- 1. Use vacuum pump to apply vacuum to swirl control valve control vacuum check switch as shown in figure.
- 2. Start engine.
- 3. Check voltage between terminal ② and engine ground with CONSULT or tester.

Pressure	Voltage (V)
More than -18.7 kPa (-140 mmHg, -5.51 inHg)	Engine ground
-18.7 to -22.7 kPa (-140 to -170 mmHg, -5.51 to -6.69 inHg)	Engine ground or Approx. 4.8
Less than -22.7 kPa (-170 mmHg, -6.69 inHg)	Approx. 4.8

4. If NG, replace swirl control valve control vacuum check switch.

Swirl control valve control solenoid valve

Check solenoid valve air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

If NG, replace solenoid valve.

Ignition Signal (DTC: 0201)

Ignition coil & power transistor (Built into distributor)

The ignition signal from the ECM is sent to and amplified by the power transistor. The power transistor turns on and off the ignition coil primary circuit. This on-off operation induces the proper high voltage in the coil secondary circuit.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Item (Possible Cause)
P1320 0201	The ignition signal in the primary circuit is not sent during engine cranking or running. The ignition signal in the primary circuit is not sent during engine cranking or running.	 Harness or connectors (The ignition primary circuit is open or shorted.) Power transistor Resistor Camshaft position sensor Camshaft position sensor circuit

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Note: If both DTC P0340 (0101) and P1320 (0201) are displayed, perform TROUBLE DIAGNOSIS FOR DTC P0340 first. (See EC-162.)

- 1) Turn ignition switch "ON".
- 2) Select "DATA MONITOR" mode with CONSULT.
- 3) Start engine. (If engine does not run, turn ignition switch to "START" for at least 5 seconds.)

- 1) Turn ignition switch "ON".
- 2) Start engine. (If engine does not run, turn ignition switch to "START" for at least 5 seconds.)
- 3) Select MODE 3 with GST.

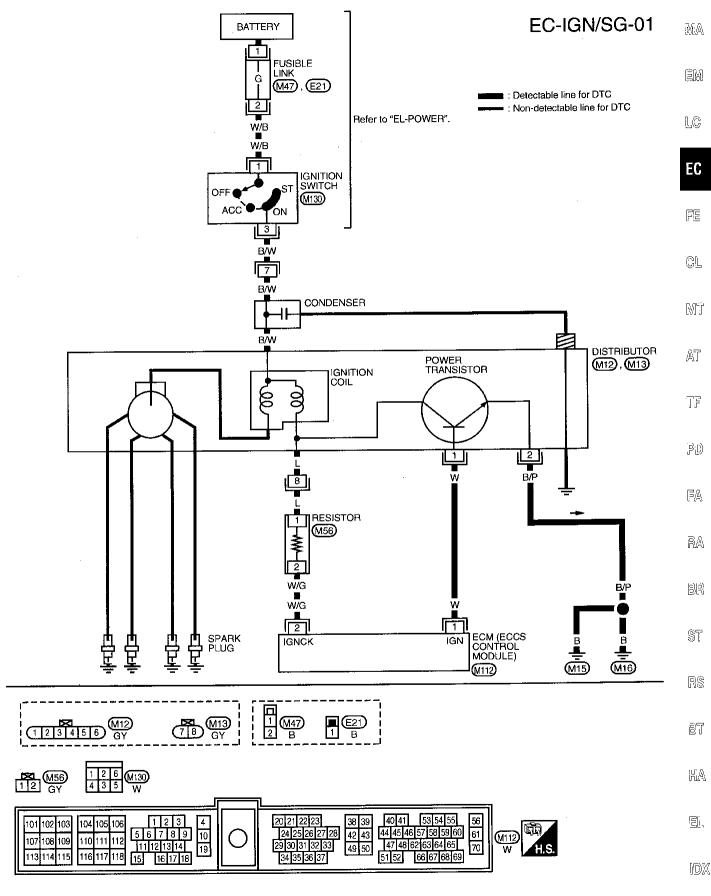

2) Start engine. (If engine does not run, turn ignition switch to "START" for at least 5 seconds.)

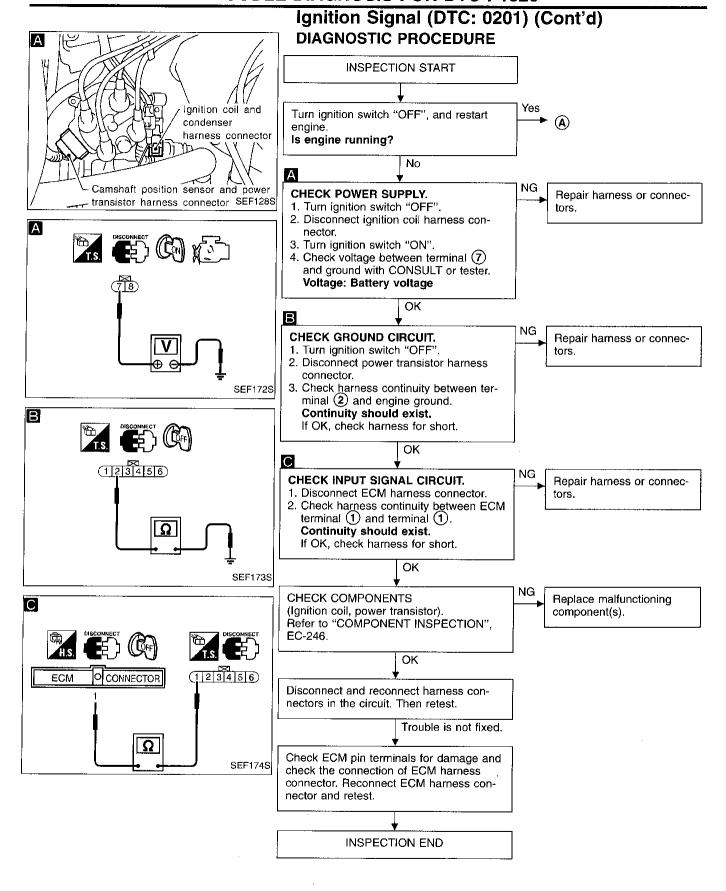

OR -

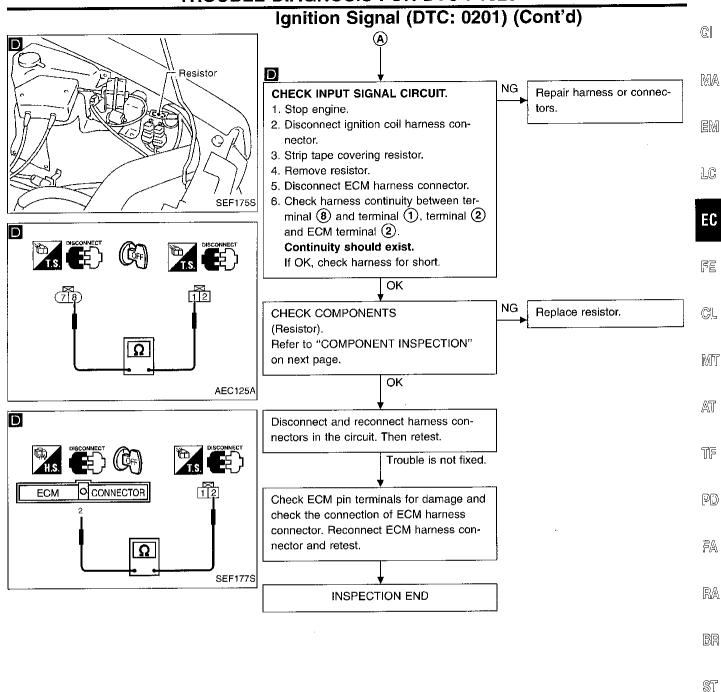

- 3) Turn ignition switch "OFF", wait at least 7 seconds and then turn "ON".
- 4) Perform diagnostic test mode II (Self-diagnostic results) with ECM.

Ignition Signal (DTC: 0201) (Cont'd) COMPONENT INSPECTION

Ignition coil

- 1. Disconnect ignition coil harness connector.
- 2. Remove distributor cap.
- 3. Check resistance as shown in the figure.

Terminal	Resistance [at 25°C (77°F)]
7 - 8	Less than 1Ω
7 - 9	7 - 13 kΩ

If NG, replace distributor assembly.

Power transistor

- 1. Disconnect camshaft position sensor & power transistor harness connector and ignition coil harness connector.
- Check power transistor resistance between terminals (2) and (8).

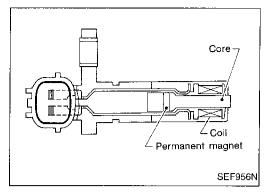

Terminals	Resistance	Result
(a) and (b)	Except 0Ω	OK
② and ⑧ 	Ω0	NG

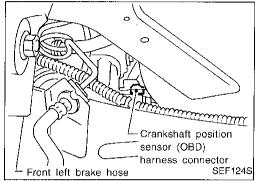

If NG, replace distributor assembly.

Resistor

- 1. Disconnect resistor harness connector.
- 2. Check resistance between terminals 1 and 2. Resistance: Approximately 2.2 k Ω

If NG, replace resistor.

Crankshaft Position Sensor (CKPS) (OBD) (COG) (DTC: 0905)

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not directly used to control the engine system. It is used only for the on board diagnosis of misfire.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1336 0905	 A chipping of the flywheel or drive plate gear tooth (cog) is detected by the ECM. 	 Harness or connectors Crankshaft position sensor (OBD) Flywheel (Drive plate)

 Resistance: Approximately 166.5 203.5Ω at 20°C (68°F)

EGRC-Solenoid Valve (DTC: 1005)

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. A plunger will then move to cut the vacuum signal (from the throttle body to the EGR valve.)

When the ECM sends an OFF signal, the vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.

EGR Temperature Sensor (DTC: 0305)

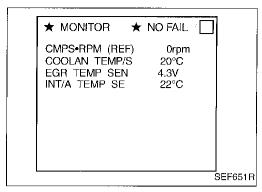

The EGR temperature sensor detects temperature changes in the EGR passage way. When the EGR valve opens, hot exhaust gases flow, and the temperature in the passage way changes. The EGR temperature sensor is a thermistor that modifies a voltage signal sent from the ECM. This modified signal then returns to the ECM as an input signal. As the temperature increases, EGR temperature sensor resistance decreases.

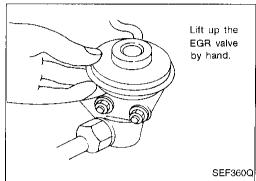

This sensor is not directly used to control the engine system. It is used only for the on board diagnosis.

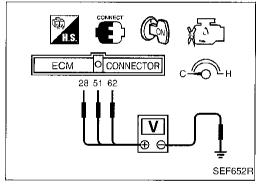

(Reference data)

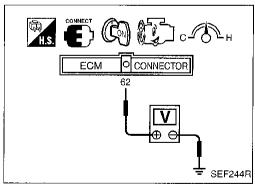

EGR temperature °C (°F)	Voltage (V)	Resistance $(M\Omega)$

EGR Temperature Sensor (DTC: 0305) (Cont'd) OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EGR temperature sensor. During this check, a DTC might not be confirmed. **Procedure for malfunctions A and B**

- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- Confirm that engine coolant temperature and intake air temperature are lower than 40°C (104°F). (If necessary, wait until the temperatures equal atmospheric temperature.)
- 3) Confirm that "EGR TEMP SEN" reading is between 3.45V and 5.0V.
- 4) Start engine and warm it up sufficiently.
- 5) Run engine at idle for at least 2 minutes.
- 6) Confirm that EGR valve is not lifting. If NG, go to TROUBLE DIAGNOSES FOR DTC P0400 and P0402. (See pages EC-166 and 174.)
- 7) Read "EGR TEMP SEN" at about 1,500 rpm with EGR valve lifted up to the full position by hand.
- Voltage should decrease to less than 1.0V.

 B) If step 7 is OK, perform TROUBLE DIAGNOSES FOR DTC P0400, P0402 and P1400. (See pages EC-166, 174 and 251.)

- 1) Turn ignition switch "ON".
- 2) Confirm that voltage between ECM terminals (1), (28) and ground are more than 2.72V. (If necessary, wait until engine coolant temperature and intake air temperature equal atmospheric temperature.)

OR -

- 3) Confirm that voltage between ECM terminal @ and ground is between 3.45V and 5.0V.
- 4) Start engine and warm it up sufficiently.
- 5) Run engine at idle for at least 2 minutes.
- 6) Confirm that EGR valve is not lifting. If NG, go to TROUBLE DIAGNOSES FOR DTC P0400 and P0402. (See pages EC-166 and 174.)
- 7) Check voltage between ECM terminal @ and ground at about 1,500 rpm with EGR valve lifted up to the full position by hand.
 - Voltage should decrease to less than 1.0V.
- 8) If step 7 is OK, perform TROUBLE DIAGNOSES FOR DTC P0400, P0402 and P1400. (See pages EC-166, 174 and 251.)

Vacuum Cut Valve Bypass Valve (DTC: 0801)

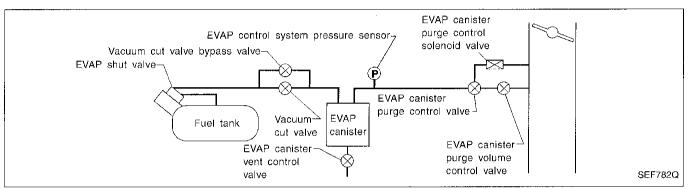

The vacuum cut valve and vacuum cut valve bypass valve are installed in parallel on the EVAP purge line between the fuel tank and the EVAP canister.

The vacuum cut valve prevents the intake manifold vacuum from being applied to the fuel tank.

The vacuum cut valve bypass valve is a solenoid type valve and generally remains closed. It opens only for on-board diagnosis.

The vacuum cut valve bypass valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the valve is opened. The vacuum cut valve is then bypassed to apply intake manifold vacuum to the fuel tank.

Evaporative Emission (EVAP) Canister Purge Volume Control Valve (DTC: 1008)

SYSTEM DESCRIPTION

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control valve changes to control the flow rate. A built-in step motor moves the valve in steps corresponding to the ECM output pulses. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control valve uses a step motor to control the flow rate of fuel vapor from the EVAP canister. This motor has four winding phases. It operates according to the output pulse signal of the ECM. Two windings are turned ON and OFF in sequence. Each time an ON pulse is issued, the valve opens or closes, changing the flow rate. When no change in the flow rate is needed, the ECM does not issue the pulse signal. A certain voltage signal is issued so that the valve remains at that particular opening.

EVAP canister purge volume control valve

- 1. Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal ② and terminals ①, ③
 - terminal (5) and terminals (4), (6)

Resistance:

Approximately 30 Ω [At 25°C (77°F)]

- 3. Reconnect EVAP canister purge volume control valve harness connector.
- 4. Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 - (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5. Turn ignition switch "ON".
- 6. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the valve opening. If NG, replace the EVAP canister purge volume control valve.

- 1. Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal ② and terminals ①, ③

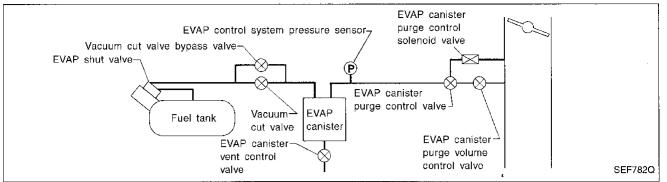

- OR -

terminal 5 and terminals 4, 6 Resistance:

Approximately 30 Ω [At 25°C (77°F)]

- 3. Reconnect EVAP canister purge volume control valve harness connector.
- 4. Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 - (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5. Turn ignition switch "ON" and "OFF". Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the ignition switch position.
 - If NG, replace the EVAP canister purge volume control valve.

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111)

SYSTEM DESCRIPTION

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (nonclosed throttle), the EVAP canister purge volume control valve and EVAP canister purge control valve are open. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.

ON BOARD DIAGNOSIS LOGIC

Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a fault is determined.

EVAP control system has a leak between intake manifold and EVAP control system pressure sensor. EVAP canister pure EVAP control system between intake manifold and EVAP control system pressure sensor. EVAP control system between intake closed EVAP canister pure EVAP control system between intake manifold and EVAP control system pressure sensor. EVAP control system between intake manifold and EVAP control system pressure sensor. EVAP control system between intake manifold and EVAP control system pressure sensor. Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall monitoring function of the EVAP control system purge flow. During this check, a DTC might not be confirmed.

- 1) Lift up drive wheels (M/T models).
- 2) Start engine.
- 3) Select "EVAP SYS PRES" in "DATA MONITOR" mode with CONSULT.
- 4) Check EVAP control system pressure sensor value at idle speed.
- 5) Select "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT and set "PURG VOL CONT/V" to 20 steps by touching "UP" or "Qu".
- 6) Maintain the following conditions for at least 30 seconds. Verify that EVAP control system pressure sensor value ("EVAP SYS PRES") stays 0.1V less than the value at idle speed for at least 2 seconds.

Engine speed:

Approx. 2,000 rpm

Gear position (for M/T models):

Any position other than "Neutral" or "Reverse"

CAUTION:

Do not run vehicle at speeds greater than 80 km/h (50 MPH).

- 1) Lift up drive wheels.
- 2) Start engine and warm it up sufficiently.
- 3) Turn ignition switch "OFF", wait at least 7 seconds.

- OR ---

- 4) Start engine and wait at least 70 seconds.
- 5) Set voltmeter probes to ECM terminals (7) (EVAP control system pressure sensor signal) and (4) (ground).
- Check EVAP control system pressure sensor value at idle speed.
- Establish and maintain the following conditions for at least 30 seconds.

Air conditioner switch: ON Steering wheel: Fully turned

Headlamp switch: ON

Engine speed: Approx. 3,500 rpm

Intake manifold vacuum:

-73.3 to -60.0 kPa (-550 to -450 mmHg, -21.65 to -17.72 inHq, -10.63 to -8.70 psi)

Gear position:

M/T models

Any position other than "Neutral" or "Reverse" A/T models

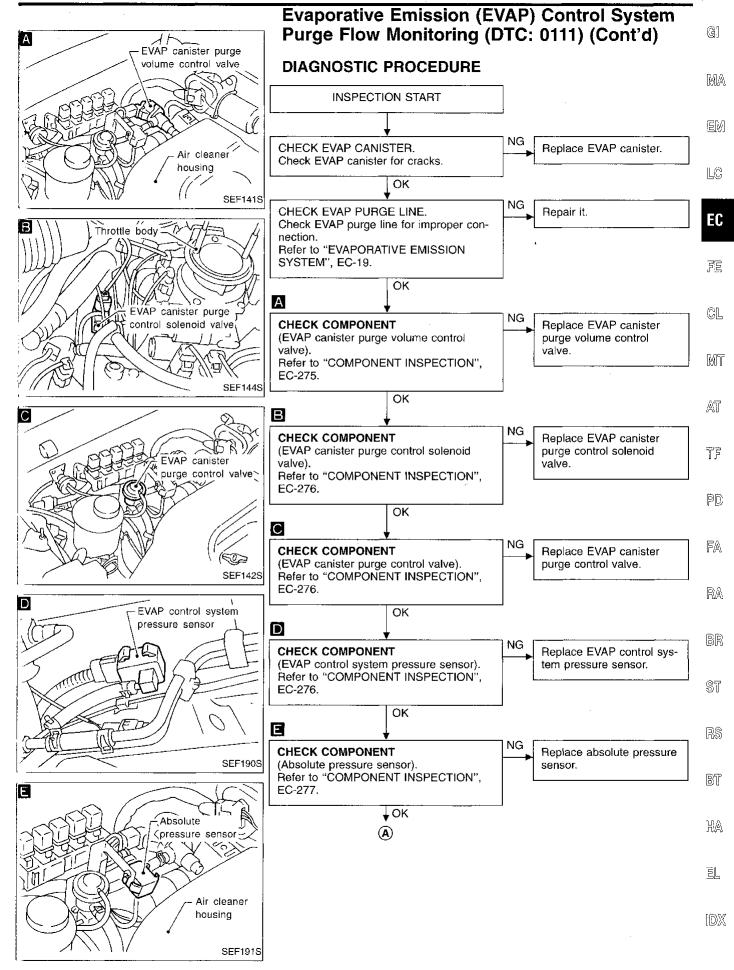

Any position other than "P", "N" or "R".

Return all conditions to normal. Repeat this procedure at least 5 times.

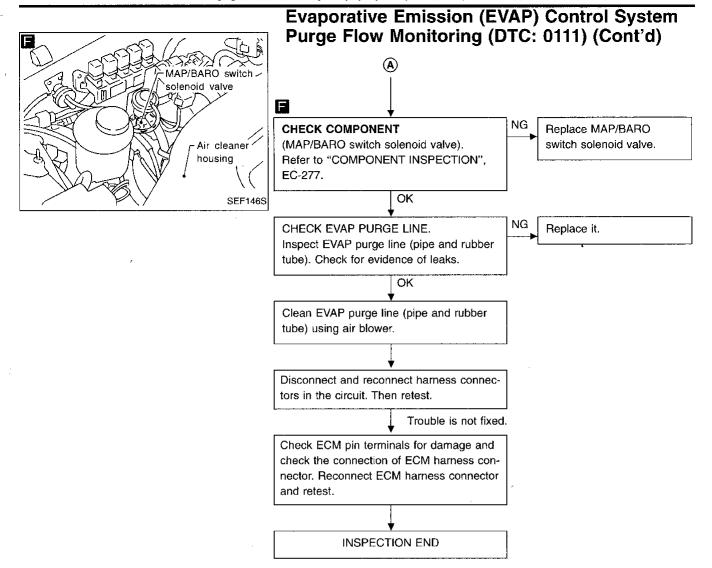

Verify that EVAP control system pressure sensor value stays 0.1V less than the value at idle speed for at least 2 seconds.

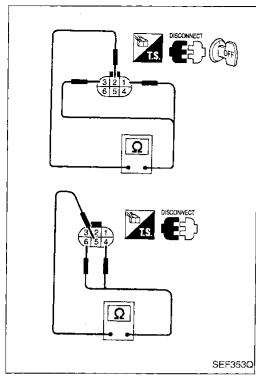

CAUTION:

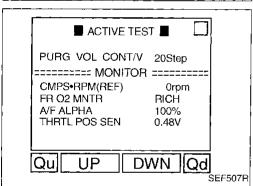

Do not run vehicle at speeds greater than 80 km/h (50 MPH).

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

EVAP canister purge control valve

Check EVAP canister purge control valve as follows:

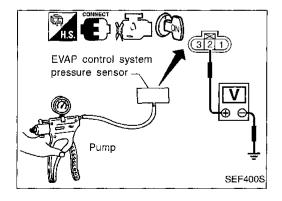

- Apply pressure [80.0 kPa (600 mmHg, 23.62 inHg, 11.60 psi)] to port (A). Then keep it for 15 seconds, and check there is no leakage.
- 3. Repeat step 2 for port ©.

EVAP canister purge control solenoid valve

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals	Yes	No
No supply	No	Yes

If NG, replace solenoid valve.

EVAP control system pressure sensor

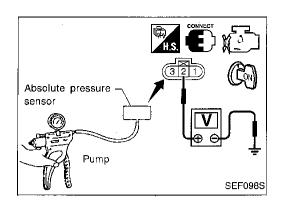

- Remove EVAP control system pressure sensor with its harness connector connected.
- 2. Remove hose from EVAP control system pressure sensor.
- 3. Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
- 4. Check output voltage between terminal ② and engine ground.

Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg, 0 psi)	3.0 - 3.6
-9.3 kPa (-70 mmHg, -2.76 inHg, -1.35 psi)	0.4 - 0.6

CAUTION:

Always calibrate the vacuum pump gauge when using it.

5. If NG, replace EVAP control system pressure sensor.

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

Absolute pressure sensor

- 1. Remove absolute pressure sensor with its harness connector connected.
- 2. Remove hose from absolute pressure sensor.
- Turn ignition switch "ON" and check output voltage between terminal ② and engine ground.

The voltage should be 3.2 to 4.8 V.

Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

Torque Converter Clutch Solenoid Valve (DTC: 0904)

SYSTEM DESCRIPTION

The ECM controls torque converter clutch solenoid valve to cancel the lock-up condition of A/T. When the solenoid valve is turned on, lock-up is cancelled. When the solenoid valve is turned off, A/T lock-up is operational.

Conditions for lock-up cancel:

- Throttle valve is fully closed (idling or deceleration)
- Engine coolant temperature is below 40°C (104°F)

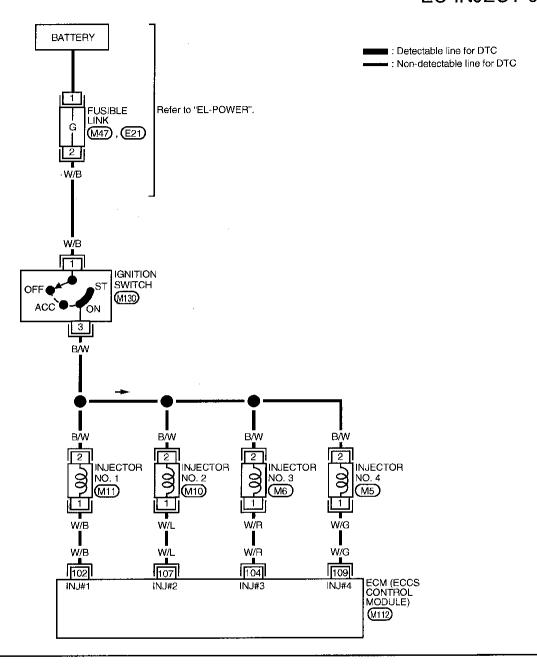

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1550 0904	 An excessively low voltage from the solenoid is sent to ECM. A/T torque converter slip is occurred in lock-up condition. 	(The circuit is open or shorted.)

Injector

EC-INJECT-01

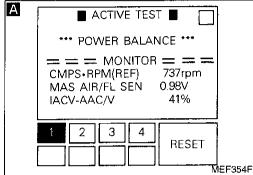

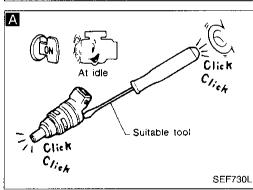

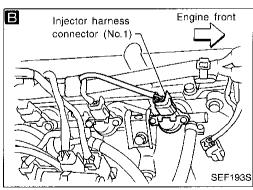

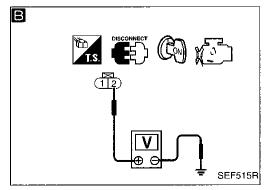

Injector (Cont'd) COMPONENT DESCRIPTION

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the injector circuit, the coil in the injector is energized. The energized coil pulls the needle valve back and allows fuel to flow through the injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

Fuel Pump

SYSTEM DESCRIPTION

The ECM activates the fuel pump for several seconds after the ignition switch is turned on to improve engine startability. If the ECM receives a 180° signal from the camshaft position sensor, it knows that the engine is rotating, and causes the pump to perform. If the 180° signal is not received when the ignition switch is on, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation
Ignition switch is turned to ON.	Operates for 5 seconds
Engine running and cranking	Operates
When engine is stopped	Stops in 1 second
Except as shown above	Stops

Fuel pump

COMPONENT DESCRIPTION

The fuel pump with a fuel damper is an in-tank type (the pump and damper are located in the fuel tank).

Resistance [at 25°C (77°F)]	kΩ	Approximately 2.2

Ω

BR

ST

*: Engine is warmed up sufficiently and idling under no-load.

THROTTLE POSITION SENSOR

Throttle valve conditions	Resistance [at 25°C (77°F)]	
Completely closed	Approximately 0.5 k Ω	
Partially open	0.5 - 4.0 kΩ	
Completely open	Approximately 4.0 k Ω	

BT

RS

HA

ĒL

ENGINE COOLANT TEMPERATURE SENSOR

T 4 00 (0E)	
Temperature °C (°F)	Resistance
20 (68)	2.1 - 2.9 kΩ
50 (122)	0.68 - 1.00 kΩ
90 (194)	0.236 - 0.260 kΩ

^{*1:} Feedback controlled and needs no adjustments

SERVICE DATA AND SPECIFICATIONS (SDS)

Inspection and Adjustment (Cont'd)

CALCULATED LOAD VALUE

	Calculated load value % (Using CONSULT or GST)
At idle	16.8 - 34.7 (2WD) 15.9 - 33.2 (4WD)
At 2,500 rpm	14.1 - 27.6 (2WD) 13.3 - 26.1 (4WD)

FRONT HEATED OXYGEN SENSOR HEATER

Resistance [at 25°C (77°F)]	Ω	3.0 - 4.0

REAR HEATED OXYGEN SENSOR HEATER

		
Resistance [at 25°C (77°F)]	Ω	3.0 - 4.0

INTAKE AIR TEMPERATURE SENSOR

Temperature °C (°F)	Resistance
20 (68)	2.1 - 2.9 kΩ
80 (176)	0.27 - 0.38 kΩ

CRANKSHAFT POSITION SENSOR (OBD)

Resistance [at 20°C (68°F)]	Ω	166.5 - 203.5
